On Sunday the 21st, Otoo came on board, to inform us, that the war canoes of Matavai, and of three other districts, were going to join those belonging to Oparree, and that part of the island, where there would be a general review. The Squadron of Matavai was soon in motion, and after parading for some time about the bay, assembled ashore, near the middle of it. Captain Cook now went in his boat to take a survey of it. What they call their war canoes, which are those with stages whereon they fight, amount to about 60 in number; and there are nearly as many more of a smaller size. The Captain was ready to have attended them to Oparree; but the chiefs resolved that they would not move till the next day. This happened to be a fortunate delay; as it afforded him an opportunity of getting some insight into their manner of fighting. He therefore desired Otoo to give orders, that some of them should go through the necessary manœuvres. Accordingly two of them were ordered out into the bay; in one of which Otoo, Captain Cook, and Mr. King embarked, and Omiah went on board the other. As soon as they had got sufficient sea-room, they faced, advanced, and retreated by turns, as quick as their rowers could paddle. In the mean time, the warriors on the stages flourished their weapons, and played a variety of antic tricks, which could answer no other purpose than that of rousing their passions, to prepare them for the onset. Otoo stood by the side of one stage, giving the necessary orders when to advance, and when to retreat. Great judgment, and a very quick eye seems to be requisite in this department, to seize every advantage, and to avoid every disadvantage. At length the two canoes closed stage to stage; and after a severe, though short conflict, all the troops on Otoo's stage were supposed to be killed, and Omiah and his associates boarded them; when instantly Otoo, and the paddlers in his canoe, leaped into the sea, as if reduced to the necessity of preserving their lives by swimming. But, according to Omiah's representation, their naval engagements are not always conducted in this manner: for they sometimes lash the two vessels together head to head, and fight till all the warriors on one side or the other are killed; yet this close combat is never practised, except when the contending parties are determined to conquer, or die. Indeed, in this instance, one or the other must infallibly happen; for they never give quarter, unless it be to reserve their prisoners for a more cruel death the day following. All the power and strength of the Society Islands lie solely in their navies. A general engagement on land we never heard of; and all their decisive actions are on the water. When the time and place of battle are fixed by both parties, the preceding day and night are spent in feasting and diversions. When the day dawns, they launch the canoes, make every necessary preparation, and with the day begin the battle; the fate of which, in general, decides the dispute. The vanquished endeavour to save themselves by a precipitate flight; and those who reach the shore fly, with their friends, to the mountains; for the victors, before their fury abates, spare neither the aged, women, nor children. They assemble the next day, at the Morai, to return thanks to the Eatooa for the victory, and offer there the slain and the prisoners, as sacrifices. A treaty is then set on foot; and the conquerors obtain usually their own terms; whereby large districts of land, and even whole islands, sometimes change their proprietors and masters. Omiah said he was once taken prisoner by the men of Bolabola, and conducted

conducted to that island, where he, and many others would have suffered death the next day, had they not been fortunate enough to escape in the night.

When the mock-fight was concluded, Omiah put on his suit of armour, mounted a stage in one of the canoes, and, thus equipped, was paddled all along the shore of the bay, that every one might have a perfect view of him. His coat of mail, however, did not engage the attention of the multitude so much as was expected; the novelty being in a great degree lost upon some of them, who had seen it before; and there were others, who had conceived such a dislike to Omiah, from his folly and imprudence at this place, that they would hardly look at any thing that was exhibited by him, however singular and new. This day notice had been given to Otoo of our intentions to sail with the first fair wind; in consequence of which on the 22nd, in the morning, he came on board, desiring to know when we proposed to depart, and, at the same time expressed great concern at our sudden resolution. He brought with him hogs, fruit, and other valuable productions of the island. No people on earth could express their gratitude with more seeming sincerity and cordiality, than the king and his chiefs, for the presents they had received, nor were our commander and officers wanting in suitable returns. The Captain having heard of there being a good harbour at Eimeo, had informed Otoo and his party, that he would visit that island in his passage to Huaheine; and they proposed now to accompany him, and that their fleet should sail, at the same time, to reinforce Towha. Being ready to take our departure, the Captain submitted to them the appointment of the day. The Wednesday following was fixed upon, when he was to receive on board Otoo, his father, mother, and the whole family. These points settled, Captain Cook proposed setting out immediately for Oparree, where all the fleet was to assemble this day, in order to be reviewed. But as he was getting into his boat, news arrived, that a treaty had been concluded between Towha and Maheine, and that Towha's fleet had returned to Attahooroo. From this unexpected event, the war canoes, instead of rendezvousing at Oparree, were ordered to their respective districts. Captain Cook, however, followed Otoo to Oparree, accompanied by Mr. King and Omiah. Soon after their arrival, a messenger from Eimeo made known the conditions of the peace, or rather truce, it being only for a limited time. The terms being disadvantageous to Otaheite, Otoo was censured severely, whose delay, it was said, in sending reinforcements, had obliged Towha to submit to a disgraceful accommodation. It was, at the same time, currently reported, that Towha, resenting the treatment he had received, had declared, that immediately after our departure, he would join his forces to those of Tiaboo, and attack Otoo. This called upon the Captain to declare, that he was determined to espouse the interest of his friend; and that whoever presumed to attack him, by any combination of parties, should experience the weight of his displeasure, when he returned to that island. This declaration, probably, had the desired effect; for, if Towha did entertain any such hostile intention at first, we heard no more of the report. Whappai, the father of Otoo, highly disapproved of the peace, and censured Towha for concluding it. This old chief wisely considered, that Captain Cook's going with them to Eimeo, might have been of singular service to their cause, though he should not take an active part in the quarrel. He therefore concluded, that Otoo had acted prudently in waiting for the Captain, though it prevented his giving that early assistance to Towha which he expected. While we were discoursing on this subject, a messenger arrived from Towha, desiring the attendance of Otoo the next day, at the morai in Attahooroo, to return thanks to the Eatooa for the peace he had concluded. Captain Cook's company was requested; but, being much out of order, chose to decline attending them. Desirous, however, of knowing what ceremony might be exhibited on such an occasion, he sent Mr. King and Omiah to observe the particulars, and returned on board, at-

tended by Otoo's mother, his three sisters, and several other women. At first the Captain imagined that this numerous train came into his boat, in order to get a passage to Matavai. But they assured him, they intended passing the night on board, for the purpose of curing the disorder he complained of; which was a rheumatic pain, extending from the hip to the foot. He accepted the friendly offer, had a bed prepared for them upon the cabin floor, and submitted himself to their directions. He was first desired to lie down among them; when all those who could get near him, began to squeeze him with both hands all over the body, but more particularly on the parts complained of, till they made his bones crack, and his flesh became almost a mummy. In short, after suffering this severe discipline, about a quarter of an hour, he was happy to get away from them. The operation, however, gave him immediate relief, and encouraged him to undergo a repetition of the same discipline, before he retired to bed; and it was so effectual, that he found himself pretty easy the whole night after. His female physicians very obligingly repeated their prescription the next morning, before they left him, and again in the evening, when they returned; after which the cure being perfected, they took their leave of the Captain the following morning. This is called by the natives romee, an operation far exceeding that of the flesh-brush, or any external friction. It is universally practiced among these islanders. Captain Wallis, and his first Lieutenant, had the same operation performed upon them. If at any time, a person appears languid and tired, and sits down by any of them, they practice the romee upon his legs, and it always has an exceeding good effect.

On Thursday the 25th, Otoo, Mr. King, and Omiah, returned from Attahooroo; and Mr. King favoured us with a narrative of what he had seen to the following purport. "At fun-fet, we embarked in a canoe, and left Oparree. About nine o'clock, we landed at that extremity of Tettaha, which joins to Attahooroo. The meeting of Otoo and Towha, I expected would be interesting. Otoo, and his attendants, seated themselves on the beach, near the canoe in which Towha sat. He was then asleep; but being awakened, and Otoo's name mentioned to him, a plantain tree and dog were immediately laid at Otoo's feet; and several of Towha's people came and conversed with him. After I had been, for some time, seated close to Otoo, Towha neither stirring from his canoe, nor saying any thing to us, I repaired to him. He asked me, if Toote was displeased with him? I answered no; that he was his taio; and that I was ordered to repair to Attahooroo, to let him know it. Omiah then entered into a long conversation with this chief, but I could not gather any information from him. On my returning to Otoo, he desired that I would go to eat, and then to sleep; in consequence of which Omiah and I left him. On my questioning Omiah on that head, he said, Towha was lame, and therefore could not stir; but that he and Otoo would soon converse in private. This was probably true; for those we left with Otoo came to us in a little time; and about ten minutes after, Otoo himself arrived, when we all went to sleep in his canoe. The next morning the awa was in great plenty. One mau drank to such excess that he lost his senses, and appeared to be convulsed. He was held by two men, who busied themselves in plucking off his hair by the roots. I left this spectacle to see a more affecting one: it was the meeting of Towha and his wife, with a young girl, who was said to be his daughter. After the ceremony of cutting their heads, and discharging plenty of blood and tears, they washed, embraced the chief, and appeared perfectly unconcerned. But the young girl's sufferings were not yet concluded, Terridiri (Oberea's son) arrived; and she, with great composure, repeated those ceremonies to him, which she had just performed on meeting her father. Towha having brought in a war canoe from Eimeo, I inquired if he had killed the people belonging to her, and was informed, that there was not a single person in her when she was captured. About ten o'clock we left Tettaha, and landed close

close to the Morai of Attahooroo, early in the afternoon. Three canoes lay hauled upon the beach, opposite the Morai, having three hogs in each. We expected the solemnity would have been performed the same afternoon; but nothing was done, as neither Towha nor Potatou had joined us. A chief came from Eimeo with a small pig, and a plantain tree, which he placed at Otoo's feet. They conversed some time together, and the Eimeo chief often repeating the words warry, warry, "false," Otoo was probably relating to him what he had heard, and the other contradicted it. The next day, Towha and Potatou, with seven or eight large canoes, arrived, and landed near the Morai. Several plantain trees were brought to Otoo, on behalf of different chiefs. Towha remained in his canoe. The ceremony commenced, by the principal priest bringing out the Maro, wrapped up, and a bundle of a conic shape. These were placed at the head of what I supposed to be a grave. Then three priests sat down at the other end of the grave; having with them a plantain tree, a branch of some other kind of tree, and the sheath of the flower of the cocoa-nut. The priests separately repeated sentences; and, at intervals, two, sometimes three, chanted a melancholy lay, very little attended to by the natives. This kind of recitative continued near an hour. Then, after a short prayer, the chief priest uncovered the maro, and Otoo rose up, wrapping it about him, and holding in his hand a bonnet, composed of the red feathers of the tropic bird, mixed with other blackish feathers. He stood opposite the three priests, who continued their prayers for about ten minutes; when a man rising suddenly from the crowd, said something ending with heiva! and the people echoed back to him three times Earee! The company then repaired to the opposite side of a large pile of stones, where is the king's morai; which is not much unlike a large grave. Here the same ceremony was again performed, and ended with three cheers. The maro was now wrapped up, and ornamented by the addition of a small piece of red feathers. The people proceeded to a large hut, near the Morai, where they seated themselves in solemn order. An oration was made by a man of Tiaraboo, which ended in about ten minutes. He was followed by another of Attahooroo: Potatou spoke next, and with much more fluency and grace than any of them. Tooteo, Otoo's orator exhibited after him, and then a man from Eimeo. Some other speeches were made, but not attended to. Omiah said, that the substance of their speeches recommended friendship, and not fighting; but as many of the speakers expressed themselves with great warmth, there were, perhaps, some recriminations, and protestations of their future good intentions. In the midst of their harangues, a man of Attahooroo rose up, having a sling fastened to his waist, and a large stone upon his shoulder. After parading for about fifteen minutes in the open space, and chanting a few short sentences, he threw the stone down. This stone, together with a plantain tree that lay at Otoo's feet, were, at the conclusion of the speeches, carried to the Morai, one of the priests, and Otoo with him, saying something on the occasion. Returning to Oparree, the sea breeze having set in, we were obliged to land, and had a pleasant walk from Tettaha to Oparree. A tree, with two large bundles of dried leaves suspended upon it, pointed out the boundary of the two districts. We were accompanied by the man who had performed the ceremony of the stone and sling. With him Otoo's father held a long conversation, and appeared extremely angry. He was enraged, as I understood, at the part which Towha had taken in the Eimeo business.

From what can be judged of this solemnity, as related from Mr. King, it had not been only a thanksgiving, as Omiah told us, but rather a confirmation of the treaty. The grave, mentioned by Mr. King, appears to be the very spot where the celebration of the rites began, when the human sacrifice was offered, at which Captain Cook was present, and before which the victim was laid. It is here also that they first invest their kings with the Maro. Omiah, who had

seen the ceremony when Otoo was made king, described the whole solemnity when we were here; which is nearly the same as that now related by Mr. King, though perhaps upon a very different occasion. The plantain-tree is always the first thing introduced in all their religious ceremonies, as well as in all their public and private debates, and probably on many other occasions. While Towha was at Eimeo, he sent one or more messengers to Otoo every day. Every messenger, at all times, carried a young plantain-tree in his hand, which he laid at the feet of Otoo before he mentioned his errand, after which he seated himself before him and related particulars. When two men are in such high dispute that blows are expected to ensue, if one should lay a plantain-tree before the other, they both become cool, and proceed in the argument without further animosity. It is indeed the olive branch of these people upon all occasions.

On Friday, the 26th, all the women were ordered to be put on shore; a task not easily effected, most of them being very unwilling to depart: nor was it of much consequence, as they found means to follow us afterwards to Huaheine, Ulietea, and the other Society Isles; nor did they leave us till our final departure to our northern discoveries, never more to return. Our friends knowing, by this, we were upon the point of sailing, they all paid us a visit, and brought more hogs than we wanted; for we had sufficient for our present use, and had no salt left to preserve any. On the 27th, Captain Cook accompanied Otoo to Oparree; and before he left it, took a survey of the cattle and poultry which he had consigned to his friend's care. Every thing was in a promising way, and properly attended to. Two of the geese, and two of the ducks were sitting; but the pea-hen and turkey-hen had neither of them begun to lay. He took four goats from Otoo, two of which he intended to leave at Ulietea, and to reserve two for the use of any other islands he might touch at in his passage to the north. On the 28th, Otoo came on board, and informed Captain Cook that he had got a canoe, which he desired he would take with him as a present from the Earee of Oraheite to the Eareerahie no Pretanne. The Captain was highly pleased with Otoo for this mark of his gratitude. At first, the Captain supposed it to have been a model of one of their vessels of war, but it proved to be a small ivahab, about 16 feet long. It was double, and probably had been built for the purpose, and was decorated with carved work, like their canoes in general. It being too large to take on board, the Captain could only thank him for his good intention, but the king would have been much better pleased if his present could have been accepted. The following circumstance, concerning Otoo, will shew that the people of this island are capable of much address and art to accomplish their purposes. Among other things which the Captain had at different times given to this chief, was a spying-glass: having been two or three days possessed of it, he perhaps grew tired of his glass, or discovered that it could not be of any use to him; he therefore carried it privately to Captain Clerke, telling him, that he had got a present for him, in return for his friendship, which he supposed would be agreeable: "but (says Otoo) Toote must not be informed of this, because he wanted it, and I refused to let him have it." Accordingly, he put the glass into Captain Clerke's hands, assuring him, at the same time, that he came honestly by it. Captain Clerke, at first, wished to be excused from accepting it; but Otoo insisted that he should, and left it with him. A few days after, he reminded Captain Clerke of the glass; who, though he did not wish to have it, was yet desirous of obliging Otoo; and thinking a few axes would be most acceptable, produced four, and offered them in exchange. Otoo immediately exclaimed, "Toote offered me five for it." Well, says Captain Clerke, if that be the case, you shall not be a loser by your friendship for me; there are six axes for you. He readily accepted them, but again desired that Captain Cooke might not be made acquainted with the transaction.

By

By calms, and gentle breezes from the west, we were detained here some time longer than we expected, during which the ships were crowded with our friends, and surrounded with canoes, for none of them would quit the place till we departed. At length, on Monday the 29th, at three o'clock P. M. the wind came at east, and we weighed anchor. When the Resolution and Discovery were under sail, to oblige Otoo, and to gratify the curiosity of his people, we fired several guns; after which all our friends, except his majesty, and two or three more, took leave of us with such lively marks of sorrow and affection, as sufficiently testified how much they regretted our departure. Otoo being desirous of seeing the Resolution sail, she made a stretch out to sea, and then in again immediately, when the king took his last farewell, and went ashore in his canoe. It was strictly enjoined to the Captain by Otoo, to request, in his name, the Eareerahie no Pretanne, to send him by the next ship some red feathers, and the birds which produce them, also axes, half a dozen muskets, powder and shot, and by no means to forget horses. When these people make us a present, it is customary for them to let us know what they expect in return; and we find it convenient to gratify them, by which means our presents come dearer to us than what we obtain by barter. But being sometimes pressed by occasional scarcity, we could have recourse to our friends for a supply, as a present, when we could not get it by any other method. Upon the whole, therefore, this way of traffic was full as advantageous to us as to the natives. In general, we paid for each lot or separate article as we received them, except in our intercourse with Otoo. His presents were so numerous, that no account was kept between him and the Captain. Whatever this chief desired, if it could be spared, was never denied him, and the Captain always found him moderate in his demands.

If the Captain could have prevailed on Omiah to fix his residence at Otaheite, we should not have quitted the island so soon as we did: for there was not even a probability of our being better supplied with provisions elsewhere, than we continued to be here, even at the time of our leaving it. Besides, such a friendship and confidence subsisted between us and the inhabitants, as could hardly be expected at any other place; and it was rather extraordinary, had never once been interrupted or suspended by any accident or misunderstanding, nor had there been a theft committed worthy of notice. It is probable, however, that their regularity of conduct resulted from their fear of interrupting a traffic which might procure them a greater share of our commodities than they could obtain by plunder or pilfering. This point, indeed, was settled, in some degree, at the first interview with their chiefs, after our arrival; for the Commodore declared then to the natives, in the most decisive terms, that he would not suffer them to rob us, as they had formerly done. Omiah was singularly useful in this business, being instructed by the Captain to point out to them the happy consequences of their honest conduct, and the fatal mischiefs that must attend a deviation from it. But the chiefs have it not always in their power to prevent thefts; they are often robbed themselves; and complain of it as the worst of evils. The most valuable things that Otoo received from us, were left in the Captain's possession till the day before we sailed, the king declaring that they could be no where so safe. From the acquisition of new riches, the inducements to pilfering must certainly have increased, and the chiefs are sensible of this, from their being so extremely desirous of having chests. The few that the Spaniards left among them are highly prized; and they are continually asking us for some. We have already mentioned one having been made for Otoo, at his request, the dimensions of which were eight feet in length, five in breadth, and about three in depth. Locks and bolts are not considered as a sufficient security, but it must be large enough for two people to sleep upon, and consequently guard it in the night.

It may appear extraordinary, that we could not get

any distinct account of the time when the Spaniards arrived, the time they staid, and when they departed. The more we made enquiry into this matter, the more we were convinced of the incapability of most of these people to remember, calculate, or note the time, when past events happened, especially if for a longer period than eighteen or twenty months. It however appeared, from the inscription upon the cross, and by the information of the natives, that two ships came to Oheitepeha Bay, in 1774, not long after Captain Cook left Matavai, which was in May the same year. The live stock they left here consisted of one bull, some goats, hogs, and dogs, and the male of another animal, which we were afterwards informed was a ram, at this time at Bolabola. The hogs, being large, have already much improved the breed originally found by us upon the island; and, on our arrival, were very numerous. Goats are also in plenty, there being hardly a chief without them. The dogs that the Spaniards put ashore are of two or three sorts; had they all been hanged, instead of being left upon the island, it would have been better for the natives. A young ram we had sell a victim to one of these animals. Four Spaniards remained on shore when their ships left the island, two of whom were priests, one a servant, and the other was much caressed among the natives, who distinguish him by the name of Mateema. He seems to have so far studied their language, as to have been able to speak it; and to have been indefatigable in impressing in the minds of the Otaheiteans exalted ideas of the greatness of the Spanish nation, and inducing them to think meanly of that of the English. He even assured them, that we no longer existed as an independent nation; that Pietanne was but a small island, which they had entirely destroyed; and as to Captain Cook, they had met with him at sea, and with a few shot had sent his ship, and every soul in her, to the bottom, so that his visiting Otaheite was, of course, at this time, very unexpected. Many other improbabilities were propagated by this Spaniard, and believed by the inhabitants; but Captain Cook's returning to Otaheite was considered as a complete refutation of all that Mateema had advanced. With what views the priests remained cannot easily be conceived. If it was their intention to convert the natives to the catholic faith, they certainly have not succeeded in a single instance. It does not appear, indeed, that they ever attempted it; for the natives say, they never conversed with them, either on this or any other subject. The priests resided the whole time at Oheitepeha; but Mateema roved about continually, visiting many parts of the island. After he and his companions had staid ten months, two ships arriving at Otaheite took them aboard, and sailed in five days. Whatever design the Spaniards might have had upon this island, their hasty departure shews they have now laid it aside. They endeavoured to make the natives believe, that they intended to return, and would bring with them houses, all kinds of animals, and men and women who were to settle on the island. Otoo, when he mentioned this to Captain Cook, added, that if the Spaniards should return, he would not permit them to enter Matavai fort, which, he said, was ours. The idea pleased him; but he did not consider that an attempt to complete it would deprive him of his kingdom, and his people of their liberty. Though this shews how easily a settlement might be effected at Otaheite, it is hoped that such an event might never take place. Our occasional visits may have been of service to its inhabitants, but (considering how most European establishments among Indian nations are conducted) a permanent settlement at this island would, probably, give them just cause to lament that our ships had ever discovered it. Indeed, a measure of this kind can hardly ever be seriously thought of, as it can neither answer the purposes of public ambition, nor of private avarice.

We have already observed, that Captain Cook received a visit from one of the two natives of this island who had been taken to Lima by the Spaniards. It is somewhat remarkable that we never saw him afterwards,

afterwards, especially as the Captain received him with uncommon civility. It was supposed that Omiah, from motives of jealousy, had kept him from the Captain, he being a traveller, who, in some degree, might vie with himself. Our touching at Teneriffe was a lucky circumstance for Omiah, who prided himself in having visited a place belonging to Spain, as well as this man. Captain Clerke, who had seen the other traveller, spoke of him as a low fellow, a little out of his senses; and his own countrymen entertained the same opinion of him. In short, those two adventurers seemed to be held in little or no esteem. They had not been so fortunate, it is true, as to return home with such valuable property as had been bestowed upon Omiah, whose advantages are so great from having been at England, that if he should sink into his original state of indolence, he has only himself to blame for it; and we are inclined to think this will be the consequence of his indiscreet behaviour. Some time before, the Captain, his unchangeable friend and patron, had made up a suit of colours for him, but he considered them as too valuable to be used at this time, and therefore patched up a parcel of flags and pendants, to the number of ten or a dozen, which he spread on different parts of his canoe. This, as might be expected, drew a great number of people to look at her. He had completely stocked himself with cloth and cocoa-nut oil, which are better and more plentiful at Otaheite than at any of the Society Isles, inasmuch, that they are considered as articles of trade. Omiah would not have behaved so inconsistently, as he did in many instances, had it not been for his sister and brother-in-law, who, together with a few select companions, engrossed him to themselves, in order to strip him of every article he possessed: and they would certainly have succeeded, if Captain Cook had not taken the most useful articles of his property into his possession. However, Omiah would not have been saved from ruin, if the Captain had permitted these relations and friends of his to have accompanied him to his intended place of settlement at Huaheine. This, indeed, was their intention, but our Commodore disappointed their farther views of plunder, by forbidding them to appear at Huaheine, while he continued at the Society Islands, and they knew him well enough not to comply.

On Tuesday, the 30th, having failed from Otaheite, we continued our course under doubled reefed top-sails, and stood for the north end of the island of Eimeo. Omiah, in his canoe, arrived there before us, and endeavoured, by taking some necessary measures, to shew us the best anchoring place. We were not, however, without pilots, having several natives of Otaheite on board, and among them not a few women. Unwilling to rely wholly on these guides, two boats were sent to examine the harbour, when, observing the signal made for safe anchorage, we stood in with both the ships close up to the head of the inlet, where we cast anchor in ten fathoms water, over a bottom of soft mud, and moored with a hawser fast to the shore. The name of this harbour is Taloo. It is situated on the north side of the island, and in the district of Oboonohoo, or Poonehoo, and runs above two miles between the hills, S. or S. by E. It is not inferior to any harbour that we have met with in this ocean, both for security and goodness of bottom. It has also this singular advantage, that a ship can sail in and out with the reigning trading wind. Several rivers fall into it, one of which is so considerable, as to admit boats a quarter of a mile up, where the water is perfectly fresh. The banks, on the sides of this stream, are covered with what the natives call the Pooroo-tree, on which they set no value, as it serves only for firing: so that fuel and water may be procured here with great facility. The harbour of Parowroah, on the same side of the island, is about two miles to the eastward, and is much larger within than that of Taloo; but the opening in the reef lies to leeward of the harbour, and is considerably narrower. There are two or three more harbours on the south side of the island, but they are not so considerable as those we have already mentioned.

We were received by the natives of Eimeo with every mark of hospitality, great numbers of whom came aboard the ships, but from mere motives of curiosity, for they brought nothing with them for the purposes of barter.

On Wednesday the 1st of October, our live stock was landed, our carpenters sent out to cut wood, and our purveyors to collect hogs. Here we found Omiah, who, on his arrival, had been diverting himself and the natives with his feats of arms, and had raised their curiosity to a very high degree, by acquainting them with our intention of paying them a visit, as no European ship had ever anchored at their island before. The next day, being the 2nd, several canoes arrived, from distant parts, bringing with them a copious supply of bread-fruit, cocoa nuts, and a few hogs, which were exchanged for beads, nails, and hatchets; red feathers being not so much demanded here as at Otaheite. This day, in the morning, Captain Cook received a visit from Maheine, the chief of the island. He approached the ship with as great caution and deliberation, as if he apprehended mischief from us, knowing us to be friends of the Otaheiteans; for these people have no idea that we can be in friendship with any one, without adopting his cause against his enemies. This chief was accompanied by his wife, who, we are told, is sister to Oano, of Otaheite, whose death we heard of while we remained at this island. Captain Cook made them presents of such articles as seemed most to strike their fancy; and after staying about half an hour, they went on shore; soon after they returned with a large hog, presenting it as a return for the Captain's favour; but he made them an additional gift to the full value of it; after which they went on board the Discovery to visit Captain Clerke. Maheine, supported with a few adherents, has made himself, in some degree, independent of Otaheite. He is between forty and fifty years of age, and is bald-headed, a circumstance rather uncommon, in these islands, at that age. He seemed ashamed of showing his head, and wore a kind of turban to conceal it. Whether they considered this deficiency of hair disgraceful, or whether they supposed we considered it in that light, is not easy to determine; the latter, however, appears the most probable, from the circumstance of their having seen us shave the head of one of the natives, whom we detected stealing. They naturally concluded, therefore, that this was a kind of punishment inflicted by us upon all thieves; and some of our gentlemen, whose heads were but thinly covered with hair, were violently suspected by them of being tetos. Towards the evening, Captain Cook and Omiah mounted on horseback, and rode along the shore. Omiah having forbid the natives to follow us, our train was not very numerous; the fear of giving offence having got the better of their curiosity. The fleet of Towha had been stationed in this harbour, and though the war was but of short duration, the marks of its devastation were very numerous and every where conspicuous. The trees had lost all their fruit, and the houses in the neighbourhood had been burnt, or otherwise destroyed.

On Monday the 6th, we hauled the ship off into the stream, intending to put to sea the next day, but the following disagreeable incident prevented it. We had, in the morning, sent our goats ashore to graze; and, in the evening, the natives contrived to steal one of them, notwithstanding two men had been appointed to look after them. This was a considerable loss, as it interfered with the Captain's views of stocking other islands with those animals: he, therefore, was determined, if possible, to recover it. On the 7th, we received intelligence, that it had been conveyed to Maheine, who was, at that time, at Parowroah harbour. Two elderly men offered their services to conduct any of our people to him, in order to bring back the goat. The Captain, therefore, dispatched some of our people in a boat, charged with a message to that chief, and insisted on both the goat and the thief being immediately given up. Maheine had, only the day before, requested the Commodore to give him two goats; but, as there were none

of these animals at some other islands, he refused to gratify him. Willing, however, to oblige him in this particular, he desired an Otaheite chief, then present, to request of Otoo, in his name, to convey two goats to Maheine, and to ensure his compliance, sent him, by the same chief, a quantity of red feathers, equal in value to the two goats that were required. The Commodore expected that Maheine, and all the other chiefs of the island, would have been perfectly satisfied with this arrangement; but he was mistaken, as the event clearly proves. Little suspecting that any one would presume to steal a second, while the necessary measures were taken to recover the first, the goats were again put ashore this morning; and a boat, as usual, was sent for them in the evening. While our people were getting them into the boat, one was conveyed away undiscovered. As it was missed immediately, we expected to recover it without much trouble, as it could not have been carried to any considerable distance. Several of the natives set out after it, different ways; for they all endeavoured to persuade us, that it must have strayed into the woods; not one of them admitting that it was stolen. We were, however, convinced of the contrary, when we found not one of the pursuers returned: their intention being only to amuse us, till their prize was safely deposited; and night coming on prevented all farther search. At this instant, the boat returned with the other goat, and one of the persons who had purloined it. The next morning being Wednesday the 8th, most of the natives were moved off. They had carried with them a corpse that lay on a toopapoo, opposite the ship; and Maheine, we were informed, had retired, to the remotest part of the island. It now plainly appeared, that a regular plan had been projected to steal what the Commodore had refused to give; and that, having restored one, they were determined not to part with the other, which was a female, and with kid; and the Commodore was equally resolved to have it back again: he, therefore, applied to the two elderly men, who had been instrumental in recovering the first, who informed him that this had been taken to a place on the south side of the island, called Watea, by Hamoa, who was the chief of that district; but that it would be delivered up, if we sent and demanded it. They shewed a willingness to conduct some of our people to the spot; but finding that a boat might go and return in one day, one was immediately dispatched with two of our officers, Mr. Roberts, and Mr. Shuttleworth; one to remain with the boat, if she could not get to the place, while the other went with the guides, accompanied by some of our people. The boat returned in the evening, when we were informed by the officers, that, after proceeding in the boat as far as rocks and shoals would permit, Mr. Shuttleworth landed; and, attended with two marines, and one of the guides, went to the house of Hamoa, at Watea, where, for some time, they were amused by the natives, who pretended they had sent for the goat, and that it would soon be produced. But as it did not arrive, and night approaching, Mr. Shuttleworth resolved to give over the fruitless search, and return to his boat. Captain Cook now lamented that he had proceeded so far in the business, seeing he could not retreat with credit, nor without giving encouragement to other islanders to rob us with impunity. Upon consulting with Omiah, and the two old men, they advised us, without hesitation, to advance up the country with a party of men, and shoot every person they should meet with. The Captain did not approve of the bloody part of this counsel; nevertheless, early the next morning, being the 9th, he set out with thirty-five of our people, accompanied by Omiah, one of the old men, and three attendants. Lieutenant Williamson was also ordered round the western part of the island, with three armed boats, to meet us. We had no sooner landed, than the few remaining natives fled before us. The first person we met with on our march, was in a kind of perilous situation; for Omiah, the instant he beheld him, asked Captain Cook if he should shoot him; so fully was he persuaded, that the advice given us was imme-

diately to be carried into execution; but the Captain gave orders both to him and our guide, to let it be made known, that it was not our intention to destroy a single native. These joyful tidings soon circulated, and prevented the flight of the inhabitants. Ascending the ridge of hills, on our road to Watea, we were informed that the goat had been carried the same way, and could hardly have passed the hills: we therefore marched up in great silence, expecting to surprize the party who were bearing off the prize; but, when we arrived at the uppermost plantation, we were told, that the animal we were in search of, had, indeed, been kept there the first night, but, the next morning, was conveyed to Watea. We made no further enquiry, till we came within sight of Watea, where we were directed to Hamoa's house by some people, who also informed us, that the goat was there. We fully expected to obtain it on our arrival; but, having reached the house, the people there denied that they had ever seen it, or knew any thing about it. Hamoa himself appeared, and expressed himself to the same effect. On our first coming to Watea, several men were seen, running to and fro in the woods, with clubs and darts in their hands; and Omiah, who had ran towards them, was assaulted with stones: hence it appeared, that they intended to oppose any attempt that we might be induced to make; but, on seeing the strength of our party, had given up the design: we were confirmed in this opinion, by observing, that all their houses were empty. After having collected a few of the natives together, Omiah was directed to expostulate with them on the absurdity of their conduct, and to let them know, we had received sufficient information that the goat was in their possession; and that, if it was not without delay delivered up, we should burn all their houses and canoes; yet, notwithstanding this expostulation, they persisted in their denial of having any knowledge of it: in consequence of which we set fire to eight of their houses, and three war canoes, all which were presently consumed. We afterwards marched off to join the boats, at that time eight miles from us; and, in our rout, burnt six other war canoes, without any opposition; on the contrary, many of the natives assisted us, perhaps, more from fear than any other motive. Omiah, who was at some distance before us, came back with information, that a number of men were assembled to attack us. We prepared to receive them; but, instead of enemies, they were petitioners, with plantain trees in their hands, which they laid down before us, entreating the Commodore to spare a canoe that lay upon the spot, which he readily complied with. About four o'clock, in the afternoon, we arrived at Wharrarade, where our boats were waiting for us. This district belongs to Tiarataboonou; but this chief, together with the other principal people of the place, had fled to the hills; though we made no attack on their property, they being in amity with Otoo. Here we remained about an hour, in order to rest ourselves, and afterwards set out for the ships, where we arrived at eight o'clock in the evening; but no tidings of the goat had, at that time, been received; and, of course the operations of the day had been ineffectual.

On Friday the 10th, early in the morning, a messenger was sent off to Maheine, charged with this peremptory resolution of the Captain, that if he persisted in his refusal to deliver up the goat, a single canoe should not be left upon the island; and that hostilities should never cease, while the stolen animal remained in his possession. That the messenger might perceive the Captain was in earnest, he ordered the carpenter, in his presence, to break up three canoes that lay at the head of the harbour; and, by his order, the planks were taken on board, to serve as materials to build a house for Omiah, at the place where he intended to fix his residence. From hence, our Commander, properly attended, went to the next harbour, where he destroyed eight more canoes, and returned on board about seven in the evening. On his arrival, he was informed, that the goat had been returned half an hour before; and it appeared from good intelligence, that it came from the very place, where the inhabitants, the day before, declared

declared they knew nothing about it; but, from the message delivered to the chief in the morning, he perceived, that the Captain was not to be trifled with. Thus ended this troublesome and unfortunate business, equally to be regretted by the natives, and by Captain Cook. He was grieved to reflect, that, after refusing to assist his friends at Otaheite, in the invasion of this island, he should so soon be obliged to engage in hostilities against its inhabitants; which, perhaps, were more injurious to them, than Towha's expedition. In a memorandum of occurrences, penned by one of our officers, we find a much less favourable account of this affair than the above; the circumstances are thus related by that gentleman.

"On the 2nd of October, Maheine, accompanied by other chiefs came on board the Discovery, with large hogs by way of presents; and were presented in return with axes, hatchets, looking-glasses, &c. our purveyors were likewise much gratified, by the success they met with in marketing; purchasing the largest hogs for the merest trifles; as for instance, a hog of 200 weight, for twelve red feathers, and so in proportion. But this friendly intercourse was soon changed to a scene of desolation, that no injury we received from the pilfering disposition of the inhabitants could justify. The people had brought us every thing their island afforded, and had left it to the generosity of the purchasers to give, in return, whatever they pleased: but unfortunately a goat from our live stock was missing. It had been secretly conveyed away in the night, from the pastures in which they were placed to feed, notwithstanding the vigilance of the guard appointed to look after them. With the loss of this animal, no doubt a great prize to the thief, the Earce of the island was made acquainted by Captain Cook, and a peremptory requisition made to have it restored, on pain of having his country laid waste, his shipping destroyed, and himself personally punished for the crime of his subject. The king promised his assistance, and required time for enquiry; but, as soon as he was set at liberty, he absconded, and was no more seen. The goat being still missing, and no means used for recovering and restoring it, a party from both ships, with the marines in a body, were ordered out, to carry the threats of our commander into execution. For three days, successively, they continued their devastations, burning and destroying 200 of the best houses of the inhabitants, and as many of their large war canoes; at the same time, cutting down their fruit trees, and destroying their plantations. The natives who lived at a distance, hearing of the havoc that was made near the bay, filled their canoes with stones and sunk them, with a view to their preservation; but that availed them nothing; for the Captain ordered boats to be manned and armed; the canoes that were sunk to be weighed up and destroyed; in short, a general desolation to be carried through the whole island, should the goat be still withheld. Add to this, that two young natives of quality being found on board our ship, were made prisoners, and told they were to be put to death, if the goat should not be restored within a certain time. The youths protested their own innocence, and disclaimed all knowledge of the guilty persons; notwithstanding which, every preparation was apparently made for putting them both to death. Large ropes were carried upon the main deck, and made fast fore and aft: axes, chains, &c. were placed upon the quarter deck, in sight of the young men, whose terrors were increased by the information of Omiah, who gave them to understand that, by all these solemn preparations, their doom was finally determined. Under these gloomy apprehensions the poor youths remained till the 9th, when, about three in the afternoon, a body of between 50 and 60 natives were seen from the ship hastening to the harbour, who, when they came near, held up the goat in their arms, in raptures that they had found it, and that it was still alive. The joy of the imprisoned young men is not to be expressed; and when they were released, instead of shewing any signs of resentment, they were ready to fall down and worship their deliverers.

It can scarce be credited, when the devastation ceased, how soon the injury they had suffered was forgotten, and provisions again brought to market, as if no violence had ever been committed by us; only the Earce of the island never made his appearance. All this while numbers of the inhabitants of Otaheite, were witnesses of the severity with which this theft was punished; but it seemed to make no unfavourable impression upon them; for they continued their good offices as long as we remained in the Society isles."

On Saturday the 11th, our intercourse with the natives was renewed; several canoes bringing bread fruit and cocoa-nuts to the ships; whence our Commander concluded, they were conscious of having merited the treatment they had received; and that the cause of his displeasure being now removed, they apprehended no further mischief. Being now about to take our departure from Eimeo, we shall first just remark, that there is very little difference between the produce of this island, and that of Otaheite; but the difference in their women is remarkable. Those of Eimeo have a dark hue, are low in stature, and have forbidding features. We would observe farther, the appearance of Eimeo bears not the least resemblance to that of Otaheite. The latter being a hilly country, has little low land, except some deep valleys, and a flat border that almost surrounds it near the sea. Eimeo has steep rugged hills, running in different directions, leaving large valleys, and gently rising grounds about their sides. The hills, though rocky, are generally covered with trees almost to the tops. At the bottom of the harbour of Taloo, the ground generally rises to the foot of the hills: but the flat border on the sides, becomes quite steep at a small distance from the sea. This produces a prospect superior to any thing we saw at Otaheite. In the low grounds, the soil is a yellowish stiff mould; on the lower hills it is blacker, and more loose; and the stone which composes the hills, is of a bluish colour, interspersed with some particles of glimmer. Near the place where our ships were stationed, are two large stones, concerning which some superstitious notions are entertained by the natives. They consider them as brother and sister; that they are Eatooas, or diuities; and that they came from Ulitea, by some supernatural means.

Having procured, at this island, a large quantity of fire-wood, an article we could not supply ourselves with at Matavai, there being not a tree but what is useful to the inhabitants, and likewise a number of hogs, bread-fruit, and cocoa-nuts, at nine o'clock A. M. we weighed, having a fine breeze down the harbour; but it was so faint and variable, that we were not out at sea before noon, at which time we directed our course to Huaheine. Omiah having previously set sail before us. In the night, the weather being hazy, he lost sight of the ship and fired his gun, which was answered by the Resolution. On Sunday the 12th, we came in sight of Huaheine, and, at noon, anchored at the northern entrance of Owharre Harbour, situated on the west side of the island. Omiah, in his canoe, entered the harbour just before us, but did not land; and though many of his countrymen crowded to see him, he did not take much notice of them. Great numbers also came off to the ships, inasmuch that we were greatly incommoded by them. Our passengers immediately informed them of our transactions at Eimeo, multiplying, by ten at least, the number of canoes and houses that we had destroyed. Captain Cook was not much displeased at their giving this exaggerated account, as he found that it made a considerable impression upon all who heard it; so that he had hopes it would induce the natives of this island to treat him in a better manner than they had done in his former visit. The next morning, which was the 13th, all the principal people of the island came to our ships. This was just what our Commodore wished, as it was now high time to settle Omiah, and he supposed that the presence of these chiefs would enable him to effect it in a satisfactory manner. But Omiah now seemed inclined to establish himself at Ulitea; and if he and Captain Cook could have agreed with respect

respect to the mode of accomplishing that design, the latter would have consented to adopt it. His father had been deprived by the inhabitants of Bolabola, when they subdued Ulietea, of some land in that island; and the Captain hoped he should be able to get it restored to the son without difficulty. For this purpose, it was necessary that Omiah should be upon friendly terms with those who had become masters of the island; but he would not listen to any such proposal, and was vain enough to imagine that the Captain would make use of force to reinstate him in his forfeited lands. This prepossession preventing his being fixed at Ulietea, the Captain began to consider Huaheine as the more proper place, and therefore determined to avail himself of the presence of the chief men of that island, and propose the affair to them.

The ships were no less crowded with hogs, than with chiefs, the former being poured in upon us faster than the butchers and salters could dispatch them. Indeed, for several days after our arrival, some hundreds, great and small, were brought on board; and, if any were refused, they were thrown into the boats, and left behind. Bread-fruit, bananoes, plantains, coconuts, and yams, were brought in the same plentiful proportions, and purchased for trifles. At Otaheite we had heard, that our old friend Oree was no longer the chief of Huaheine, and that at this time he resided at Ulietea. Indeed he never had been more than regent during the minority of Taireetareea, the present Earee rahie; but he did not give up the regency till he was compelled thereunto. His two sons, Opoony and Towha, were the first who paid us a visit, coming on board before the ship was well in the harbour, and bringing with them a present; for which they received, in return, red feathers, &c. Red feathers are here, as at Otaheite, a very remarkable commodity, with which the seamen made purchases of cloth, and other manufactures of the island: those who were followed by their misses from Otaheite, kept separate tables for them, at a small expence; while the misses catered and cooked for their mates, who feasted every day on barbecued pigs, stewed fowls, roasted bread-fruit, and a variety of other delicacies, purchased by the ladies for the merest trifles. Among our foremast-men were many who laid in store of these good things for their support, in case of being reduced to short allowance; and they had reason, afterwards, to console themselves on their provident care.

The Captain now, after the hurry of business in the morning was over, prepared to make a visit in form to Taireetareea, the Earee rahie, or present reigning king of the island. Omiah, who was to accompany him, dressed himself very properly on the occasion, and provided a handsome present for the chief himself, and another for his Eatooa. Their landing drew most of the visitors from the ships, who, with many others, assembled in a large house. The concourse of people became very great, the major part of whom seemed stouter and fairer than those of Otaheite; and the number of men who appeared to be of consequence was also much greater, in proportion to the extent of the island. The Captain waited some time for the king; but when he appeared, we found his presence might have been dispensed with, as his age did not exceed ten years. Omiah, who stood at a little distance from the circle of great men, began with making his offering to the gods, which consisted of cloth, red feathers, &c. Another offering succeeded, which was to be given to the gods by the young chief; and after that, several other tufts of red feathers were presented. The different articles were laid before a priest, being each of them delivered with a kind of prayer, which was spoken by one of Omiah's friends, though in a great measure dictated by himself. In these oraisons he did not forget his friends in England, nor those who had conducted him safe back to his native country. The Earee rahie no Pretanne, the Earl of Sandwich, Toote (Captain Cooke), Tatce (Captain Clerke), were mentioned in every one of them. These offerings and prayers being ended, the priest took each of the articles

in order, and, after repeating a concluding prayer, sent every one of them to the Morai. After the performance of these religious rites, Omiah seated himself by the Captain, who bestowed a present on the young prince, and received another in return. Some arrangements were next agreed upon, relative to the mode of carrying on the intercourse between us and the natives; to whom the Captain pointed out the mischievous consequences that would attend their plundering us, as on former occasions. The establishment of Omiah was then proposed to this assembly of chiefs. They were informed, that we had conveyed him into England, where he was well received by the great King of Pretanne, and his Earees; and had been treated, during his whole stay, with all the marks of regard and affection; that he had been brought back again, and enriched with a variety of articles, which, it was hoped, would be highly beneficial to his countrymen; and that, besides the two horses which were to continue with him, many other new and useful animals had been left at Otaheite, which would speedily multiply, and furnish a sufficient number for the use of all the neighbouring islands. The Captain then gave them to understand, it was his earnest request that they would give his friend, Omiah, a piece of land, upon which he might build a house, and raise provisions for himself and family; adding, that if he could not obtain this at Huaheine, either by donation or purchase, he was resolved to carry him to Ulietea, and settle him there. We observed that this conclusion seemed to gain the approbation of all the chiefs; and the reason was not less obvious. Omiah had vainly flattered himself, that the Captain would use force in restoring him to his father's possessions, in Ulietea; and he had talked at random, on this subject, among some chiefs, at this meeting, who now expected that they should be assisted by us in an invasion of Ulietea, and driving the Bolabolans out of that island. It being proper, therefore, that they should be undeceived in this particular, the Captain, with this view, signified to them, in the most decisive manner, that he would neither give them any assistance in such an enterprise, nor even suffer it to be put in execution, while he remained in their seas; and that, if Omiah established himself in Ulietea, he should be introduced as a friend, and not forced upon the people of Bolabola as their conqueror. This peremptory declaration immediately gave a new turn to the sentiments of the council; one of whom expressed himself to this effect: that the whole island of Huaheine, and whatever it contained, were Captain Cook's, and therefore he might dispose of what portion he pleased to his friend: but, though Omiah seemed much pleased at hearing this, to make an offer of what it would be improper to accept, the Captain considered as offering nothing: he for this reason desired them to mark out the particular spot, and likewise the exact quantity of land, which they intended to grant for the settlement. Upon this, some chiefs, who had retired from the assembly, were sent for; and, after a short consultation, the Commodore's request was unanimously complied with, and the ground immediately fixed upon, adjoining to the house where the present meeting was held. It extended along the shore of the harbour, about 200 yards; its depth, to the bottom of the hill, was somewhat more; and a proportionable part of the hill was comprehended in the grant.

This affair being settled, on Saturday, the 18th, a tent was pitched on shore, a post established, and the observatories erected. As this was one of the most plentiful of the Society Isles, it was proposed to make some stay here, in order to careen the ships, and to lay in provisions for future use. This was the more necessary, as we were to sail to countries wholly unknown, where it was uncertain what accommodations we might meet with, or to what difficulties we might be subject. The beds and furniture of every kind were therefore unladen, and every crevice of the ships examined, scraped, washed with vinegar, and smoked. While this last operation was performing, the lower port-holes

View of HUAHEINE.

were left open, for the rats to make their escape; in short, a thorough revision was directed to be made of every thing on board, as well to cleanse the furniture from vermin, as to remove the danger of infection from putrid air, generated by a perpetual succession of multitudes of people, between decks, ever since our arrival at Otaheite. The sick were, at the same time, landed for the benefit of the air, and every means used to recover, and to preserve them in health when recovered. Among the sick was Captain Cook himself, for whose recovery the crews of both ships were under much concern, as the success of the voyage was thought in a great measure to depend upon his care and conduct. By the doctor's advice, he was prevailed upon to sleep on shore; where he was assiduously attended, night and day, by the surgeons of both ships, who watched with him alternately, till he was out of danger. As soon as he was able, he rode out every day with Omiah on horseback, followed by the natives, who, attracted by the novelty of the sight, flocked from the remotest parts of the island to be spectators. We also during our stay in this harbour, carried the bread on shore to clear it of vermin. The number of cockroaches that infested the ship at this time is almost incredible. The damage we sustained by them was very considerable; and every attempt to destroy them proved fruitless. If any kind of food was exposed for a few minutes, it was covered with these noxious insects, who soon pierced it full of holes, so that it resembled a honeycomb. They proved particularly destructive to birds which had been stuffed for curiosities, and were so fond of ink, that they eat out the writing on the labels fastened to different articles; and the only thing that preserved books from their ravages, was the closeness of their binding, which prevented these voracious destroyers from insinuating themselves between the leaves. According to Mr. Anderson, they were of two sorts, the *blatta orientalis*, and *germanica*. The former had been carried home in the Resolution, in her last voyage, where they withstood the severity of the winter, in 1776, though she was in dock all the time. The latter had only made their appearance since our leaving New Zealand; but had increased so fast, that they now got even into our rigging; so that when a sail was loosened thousands of them fell upon the decks. Though the *orientales* were in infinite numbers, they seldom came out but in the night, when they made a particular noise in crawling about: and, besides their disagreeable appearance, they did great mischief to our bread, which dainty feeders would have ill-relished, being so bespattered with their excrement.

The carpenters and caulkers had no sooner completed their business on board, than they were ordered on shore to erect a house for Omiah, wherein he might secure the various European commodities that he had in his possession: at the same time, others of our people were employed in making a garden for his use, planting vines, shaddocks, melons, pine-apples, and the seeds of various kinds of vegetables; all which were in a flourishing state before our departure from the island. Omiah began now to pay a serious attention to his own affairs, and heartily repented of his ill-judged prodigality at Otaheite. Here he found a brother, a sister, and a brother-in-law, the sister having been married: these did not plunder him, as his other relations had lately done; it appeared, however, that though they had too much honesty and good-nature to do him any injury, yet, they were of too little consequence in the island, to do him any real services, having neither authority nor influence to protect his property or his person. Thus circumstanced, he ran great risk of being stripped of every thing he had received from his generous benefactors, as soon as he should cease to be within the reach of our powerful protection. He was now on the point of being placed in a very singular situation, that of the only rich man in the kingdom and community of which he was to be a member; and being master of an accumulated quantity of a species of treasure, which his countrymen could not create by

any art or industry of their own, it was natural, therefore, to imagine, that while all were desirous of sharing this envied wealth, all would be ready to join in attempts to strip its sole proprietor. As the most likely means of preventing this, Captain Cook advised him to distribute some of his moveables among two or three of the principal chiefs; who, on being thus gratified, might be induced to favour him with their patronage, and shield him from the injuries of others. Omiah promised to follow this advice, and we heard, before we sailed, this prudent step had been taken. The Captain, however, not confiding wholly in the operations of gratitude, had recourse to the more forcible and effectual motive of intimidation, taking every opportunity of notifying to the inhabitants, that it was his intention to make another visit to their island, after having been absent the usual time; and that if he did not find his friend in the same state of security in which he should leave him at present, all those who had been his enemies might expect to become the objects of his resentment. This menacing declaration will, probably, have some effect; for our successive visits of late years have induced these islanders to believe, that our ships are to return at certain periods; and while they continue to entertain such a notion, which the Captain thought a fair stratagem to confirm, Omiah has some prospect of being suffered to thrive upon his new plantation.

On Wednesday, the 22d, the intercourse of trade and friendly offices, between us and the inhabitants of Huahine, was interrupted; for, in the evening, one of the latter found means to get into Mr. Bayley's observatory, and carry off a sextant, unobserved. Captain Cook was no sooner informed of this theft, than he went ashore, and desired Omiah to apply to the chiefs, to procure restitution. He accordingly made application to them, but they took no steps towards recovering the instrument, being more attentive to a heeva, that was then exhibiting, till the Captain ordered the performers to desist. Being now convinced he was in earnest, they began to make some enquiry after the delinquent, who was sitting in the midst of them, with such marks of unconcern, that the Captain was in great doubt of his being guilty, particularly as he denied it. Omiah assuring him this was the person, he was sent on board the Resolution, and put in irons. This raised an universal ferment among the islanders, and the whole body fled with precipitation. The prisoner being examined by Omiah, was with some difficulty brought to confess where he had concealed the sextant, and it was brought back unhurt the next morning. After this, the natives recovered from their consternation, and began to gather about us as usual. As the thief appeared to be a shameless villain, the Commodore punished him with greater severity than he had ever done any former culprit; for, besides having his head and beard shaved, he ordered both his ears to be cut off, and his eye-brows to be fled, than which no punishment could have subjected him to greater disgrace. In this bleeding condition he was sent on shore, and exposed as a spectacle to intimidate the people from meddling with what was not their own. The natives looked with horror upon the man, and it was easy to perceive that this act gave them general disgust: even Omiah was affected, though he endeavoured to justify it, by telling his friends, that if such a crime had been committed in the country where he had been, the thief would have been sentenced to lose his life. But, how well soever he might carry off the matter, he dreaded the consequences to himself, which, in part, appeared in a few days, and were probably more severely felt by him, soon after we were gone.

Saturday, the 25th, a general alarm was spread, occasioned by a report, that one of our goats had been stolen by the above-mentioned thief; and though, upon examination, we found every thing safe in that quarter, yet it appeared, that he had destroyed and carried off from Omiah's grounds, several vines and cabbage plants; that he had publicly threatened to put him to death, and to set fire to his house, as soon as

we should quit this place. To prevent his doing any further mischief, the Captain ordered him to be seized, and confined again on board the ship, with a view of carrying him off the island; and this intention seemed to give general satisfaction to all the chiefs. He was a native of Bolabola; but there were too many of the people here ready to co-operate with him in all his designs. We had, indeed, always met with more troublesome people in Huaheine, than in any other of the adjacent islands; and it was only from fear, and the want of proper opportunities, that induced them to behave better now. Anarchy and confusion seemed to prevail among them. Their Earee rahie, as we have already observed, was but a child; and we did not observe, that there was one individual, or any set of men, who held the reins of government for him; so that whenever any misunderstanding occurred between us, we never knew, with sufficient precision, to whom it was necessary to apply, in order to effect an accommodation, or procure redress. On Thursday, the 30th, early in the morning, our prisoner, the Bolabola-man, found means to escape from his confinement, and out of the ship, carrying with him the shackle of the bilboe-bolt that had been put about his leg, which was taken from him as soon as he arrived on shore, by one of the chiefs, and given to Omiah, who quickly came on board, to inform the Captain, that his mortal enemy was again let loose upon him. We found, upon enquiry, that the sentry placed over the prisoner, and even the whole watch in that part of the ship where he was confined; having fallen asleep, he seized the favourable opportunity, took the key of the irons out of the drawer into which he had seen it put, and set himself at liberty. This escape convinced the Commodore, that his people had been very remiss in their night-duty; which rendered it necessary to chastise those who were now in fault, and to establish some new regulations that might prevent similar negligence in future. We were pleased at hearing, afterwards, that the fellow who escaped, had gone over to Ulitea; but it was thought by some, he only intended to conceal himself till our departure, when he would revenge the indignity we had treated him with, by open or secret attacks upon Omiah. The house of this great man being now nearly finished, many of his moveables were carried ashore. Among other articles was a box of toys, which greatly pleased the gazing multitude: but as to his plates, dishes, drinking mugs, glasses, and the whole train of household apparatus, scarce one of his countrymen would even look at them. Omiah himself began to think, that they would be of no service to him; that a baked hog was more savory than a boiled one; that a plantain leaf made as good a dish or plate as pewter; and that a cocoa-nut shell was as convenient a goblet as one of our mugs. He therefore disposed of most of these articles of English furniture among the crew of our ships; and received from them, in return, hatchets, and other iron implements, which had a more intrinsic value in this part of the world. Among the numerous presents bestowed upon him in England, fireworks had not been omitted; some of which we exhibited in the evening of the 28th, before a great number of people, who beheld them with a mixture of pleasure and fear. Those that remained were put in order, and left with Omiah, pursuant to their original destination.

We now began to make preparations for our departure from Huaheine, and got every thing off from the shore this evening, except a goat big with kid, a horse and a mare, which were left in the possession of Omiah, who was now to be finally separated from us. We gave him also a boar, and two sows, of the English breed; and he had got two sows of his own. The horse had covered the mare during our continuance at Otaheite; so that the introduction of a breed of horses into these islands, has probably succeeded, by this valuable present. With regard to Omiah's domestic establishment, he had procured at Otaheite, four or five toutous or people of the lower class; the two young New Zealanders remained with him, and his brother, with some others, joined him; so that his family now consisted of ten or

eleven persons: if that can be justly denominated a family, to which not one female belonged. The house which our people erected for him was 24 feet by 18, and ten feet high: it was composed of boards, which were the spoils of our military operations at Eimeo, and in the construction of it, as few nails as possible were used, lest an inducement should arise, from a desire of iron, to pull it down. It was agreed upon, that, immediately after our departure, he should erect a spacious house, after the fashion of his own country; one end of which was to be brought over that we had built, so as entirely to enclose it for greater security. In this work, some of the chiefs of the island promised to contribute their assistance; and if the intended building should cover the ground which was marked out for it, few of the houses in Huaheine will exceed it in magnitude. Omiah's European weapons consisted of a fowling piece, two pair of pistols, several swords, cutlasses, a musket, bayonet, and a cartouch box. After he had got on shore whatever belonged to him, he invited several times the two captains, and most of the officers of both ships to dine with him; on which occasions his table was plentifully spread with the best provisions that the island could afford. Omiah, thus powerfully supported, went through the fatigues of the day better than could have been expected from the despondency that appeared in his countenance, when first the company began to assemble. Perhaps his awkward situation, between half English and half Indian preparations, might contribute not a little to embarrass him; for having never before made an entertainment himself, though he had been a partaker at many both in England and in the islands, he was yet at a loss to conduct himself properly to so many guests, all of them superior to himself in point of rank, though he might be said to be superior, in point of fortune, to most of the chiefs present. Nothing, however, was wanting to impress the inhabitants with an opinion of Omiah's consequence. The drums, trumpets, bagpipes, hautboys, flutes, violins, in short, the whole band of music attended, and took it by turns to play while dinner was getting ready; and when the company were seated, the whole band joined in full concert, to the admiration of crowds of the inhabitants, who were assembled round the house on this occasion. The dinner consisted, as usual, of the various productions of the island, barbecued hogs, fowls dressed, some after the manner of the country, and others after the English fashion, with plenty of wine and other liquors, with which two or three of the chiefs made very free. Dinner over, heevas and fire-works succeeded, and when night approached, the multitudes that attended us spectators dispersed, without the least disorder. Before we set sail, the Commodore caused the following inscription to be cut in the front of Omiah's house;

Georgius tertius, Rex, 2 Novembris, 1777.

*Naves { Resolution, Jac. Cook, Pr.
Discovery, Car. Clerke, Pr.*

November 2nd, on Sunday, at four o'clock P.M. we took the advantage of an easterly breeze, and sailed out of Owharre harbour. While here, we had procured more than 400 hogs, many of them large. Though it had been found in former voyages, that most of them which were carried to sea alive refused to eat, and consequently were soon killed, yet we resolved to make one experiment more; and by procuring large quantities of yams, and other roots, on which they were accustomed to feed on shore, we ventured to take a few in each ship; and for this purpose our carpenters had prepared styes for their reception in those parts where they might remain cool. Most of our friends, natives of Huaheine, continued on board till our vessels were under sail; when the Captain, to gratify their curiosity, ordered five of the great guns to be fired. Then they all left us, except Omiah, who remained till we were out at sea. We had come to sail by a hawser fastened to the shore, which in casting the ship, parted, being cut by the rocks, and its outer end was left behind: it therefore became necessary to dispatch a boat to bring it on shore. In this

this boat Omiah went ashore, and took a very affectionate and final leave of the Captain, never to see him more. He had endeavoured to prevail on Captain Cook to let him return to England, which made his parting with him and our officers the more affecting. If tears could have prevailed on our commander to let him return, Omiah's eyes were never dry; and if the tenderest supplications of a dutiful son to an obdurate father could have made any impression, Omiah hung round his neck in all the seeming agony of a child trying to melt the heart of a reluctant parent. He twined his arms round him with the ardour of inviolable friendship, till Captain Cook, unable any longer to contain himself, broke from him, and retired to his cabin, to indulge that natural sympathy which he could not resist, leaving Omiah to dry up his tears, and compose himself on the quarter deck. On his return, he reasoned with his friend, upon the impropriety of his request; reminding him of his anxieties while in England, lest he should never more have been permitted to return home; and now that he had been restored to his friends and country, at a great expence to his royal master, it was childish to entertain a notion of being carried back. Omiah renewed his tears and said, he had indeed wished to see his country and friends; but having seen them he was contented, and would never long for home again. Captain Cook assured him of his best wishes, but his instructions must be obeyed, which were to leave him with his friends. Such was the parting scene between Omiah and his patron; nor were the two New Zealand boys under less concern to leave us than Omiah. They had already learned to speak English enough to express their hopes and fears. They hoped to have gone along with the ships, and cried bitterly when they understood they were to be left behind. Thence arose a new scene between Omiah and his servants, that, had not the officers on the quarter deck interposed, might have ended unfortunately for the former; for they refused to quit the ship, till they were compelled to it by force, which would have been no easy matter, the eldest, near sixteen, being of an athletic make; and the youngest, about eleven, a giant of his age. They were both tractable and obliging, till they found they were to be left at Huaheine, but knowing this at our departure from that place, they grew desperate till subdued. They discovered dispositions the very reverse of the islanders, among whom they were destined to abide during the remainder of their lives; and, instead of a mean, timid submission, they shewed a manly determined resolution not to be subdued, though overcome; and ready, if there had been a possibility to succeed, to have made a second or even third attempt to have regained their liberty. We could never learn Captain Cook's reason, for refusing to take on board some of those gallant youths from New Zealand, who, no doubt, would have made useful hands in the high latitudes we were about to explore, and would besides have been living exhibitions of a people, whose portraits have been imperfectly depicted even by our best draughtsmen. There is a dauntless fierceness in the eyes and countenance of a New Zealand warrior, which the pencil of the most eminent artist cannot imitate; and we lament the non-importation of a native from every climate, where nature had marked a visible distinction in the characters of person and mind. Having bid farewell to Omiah, he was accompanied by Mr. King in the boat, who informed us, he had wept all the time he was going ashore.

Though we had now, to our great satisfaction, brought Omiah safe back to the very spot from whence he was taken, it is probable we left him in a situation less desirable than that which he was in before his connection with us; not that, having tasted the comforts of civilized life, he must become more wretched from being obliged to relinquish all thoughts of continuing them, but merely because the advantages he received from us, have placed him in a more hazardous situation, with respect to his personal safety. From being greatly caressed in England, he had lost sight of his primary con-

dition, and did not consider in what manner his acquisitions, either of knowledge, or of wealth, would be estimated by his countrymen, at his return; which were the only things whereby he could recommend himself to them now, more than before, and on which he could lay the foundation either of his future greatness or happiness. He appeared to have, in some measure, forgotten their customs in this respect, and even to have mistaken their genius; otherwise he must have been convinced of the extreme difficulty he would find in getting himself admitted as a man of rank, where there is scarcely a single instance of a person's being raised from an inferior station even by the greatest merit. Rank seems to be the foundation of all power and distinction here, and is so pertinaciously adhered to, that, unless a person has some degree of it, he will be contemned and hated, if he pretends to exercise any authority. This was really the case, in some degree, with Omiah; though his countrymen were rather cautious in expressing their sentiments while we continued among them. Nevertheless, had he made a proper use of the presents he brought with him from Great Britain, this, with the knowledge he had gained by travelling, might have enabled him to have formed the most advantageous connections: but he exhibited too many proofs of a weak inattention to this obvious means of promoting his interest. He had formed schemes of a higher nature, perhaps, with more truth, it may be said, meaner; for revenge, rather than a desire of greatness, appeared to influence him from the beginning. His father was, certainly, a man of considerable property in Ulietea, when that island was subdued by the inhabitants of Bolabola, and with many others, fled for refuge to Huaheine, where he died, and left Omiah, with several other children, who thus became entirely dependent. In this situation Captain Furneaux took him up, and brought him to England. Whether he expected, from the treatment he there met with, that any assistance would be afforded him against the enemies of his father and his country; or whether he had the vanity to suppose, that his own superiority of knowledge, and personal courage, would be sufficient to dispossess the conquerors of Ulietea, is uncertain; but, from the very commencement of the voyage, this was his constant topic. He would not pay any attention to our remonstrances on such an inconsiderate determination, but was displeased, whenever more reasonable counsels were proposed for his benefit. Nay, he was so ridiculously attached to his favourite scheme, that he affected to believe the Bolabolans would certainly quit the conquered island, as soon as they should have intelligence of his arrival in Otaheite. As we proceeded, however, on our voyage, he began to perceive his error; and, by the time of our arrival at the Friendly Islands, had such apprehensions of an unfavourable reception in his own country, that he was inclined to have remained at Tongataboo, under the protection of his friend Feenou. At these islands he squandered away a considerable part of his European treasure; and he was equally imprudent at Otaheite, till Captain Cook put a stop to his profusion. He also formed such improper connections there, that Otoo, though at first disposed to countenance him, afterwards expressed openly his disapprobation of his conduct. He might, however, have recovered the favour of that chief, and have settled, to great advantage, in Otaheite, as he had formerly lived some years there, and was now honoured with the notice of Towha, whose valuable present of a large double canoe has been already mentioned. But he continued undetermined to the last, and probably would not have adopted the plan of settlement in Huaheine, if Captain Cook had not so positively refused to employ force in restoring him to the possession of his father's property. Omiah's greatest danger, in his present situation, will arise from the very imprudent declarations of his antipathy to the Bolabolans; for those people, from motives of jealousy, will undoubtedly endeavour to render him obnoxious to the inhabitants of Huaheine; and as they are now at peace with that island, they may easily accomplish their designs. This circumstance he might, with

with great ease, have avoided; for they were not only free from any aversion to him, but the old chief, who is reputed by the natives of the Society islands, to be a priest, or god, even offered to reinstate him in his father's lands: but he peremptorily refused this; and, to the very last, continued fixed in his resolution to embrace the first opportunity of satisfying his revenge in battle. To this he is perhaps not a little stimulated by the coat of mail he brought from England; clothed in which, and furnished with fire arms, he idly imagines he shall be invincible. But the defects in Omiah's character were considerably overbalanced by his great good nature, and docile tractable disposition. Captain Cook, during the whole time he was with him, seldom had reason to be seriously displeased with his general conduct. His grateful heart ever retained the highest sense of the favours conferred on him in England; nor will he ever be unmindful of those who honoured him while in that kingdom, with their friendship and protection. Though he had a tolerable share of understanding, he shewed little application and perseverance in exerting it, so that he had but a general and imperfect knowledge of things. He was not a man much used to observation; otherwise, he might have conveyed to his native country many elegant amusements, and useful arts, to be found among the Friendly Islanders; but we never perceived, that he endeavoured to make himself master of any one of them. Such indifference is, indeed, the characteristic foible of his countrymen. Though they have been visited by Europeans, at times, for these ten years past, we could not discern the slightest vestige of any attempt to profit by this interview, nor have they hitherto imitated us but in very few respects. It must not, therefore, be expected, that Omiah will be able to introduce among them many arts and customs, or much improve those to which they have been familiarized by long habit. We trust, however, that he will exert his endeavours to bring to perfection the various fruits and vegetables that were planted by us, which will be no small acquisition. But the principal advantage these islands are likely to receive from the travels of Omiah, will probably arise from the animals that have been left upon them; which, perhaps, they never would have obtained, if he had not come over to England. When these multiply, Otaheite, and the Society Isles, will equal any place in the known world, with respect to provisions. Omiah's return, and the substantial proofs he had displayed of British liberality, encouraged many to offer themselves as volunteers to accompany us to Pretanne; but our Commodore took every opportunity of expressing his fixed determination to reject all applications of that kind: and Omiah, who was ambitious of remaining the only great traveller among them, being afraid the Commodore might be prevailed upon to place others in the same situation, as rivals, frequently reminded him of the declaration of the Earl of Sandwich, that no others of his countrymen were to be carried to England. When the Captain was about to bid farewell to Omiah, he gave him his last lessons of instruction how to act: directing him at the same time to send his boat over to Ulietea, his native island, to let him know how the chiefs behaved to him in the absence of the ships. If well, he was to send by the messenger three white beads: if they seized upon his stock, or broke in upon his plantation, three red beads: or if things remained just as we left them, he was to send three spotted beads.

As soon as the boat, in which Omiah was conveyed ashore, had returned, with the remainder of the hawker, to the ship, we hoisted her in, and stood over for Ulietea without delay. The next morning, being the 3d, we made sail round the southern end of that island, for the harbour of Ohamancoro. We met with light airs and calms alternately, so that at twelve o'clock we were still at the distance of a league from the mouth of the harbour; and while we were thus detained, Oreo, the chief of the island, with his son and son in law, came off to pay us a visit. All the boats were now hoisted out, and sent a-head to tow, being assisted by a slight southerly breeze. This soon failing, and being

succeeded by an easterly one, which blew right out of the harbour, we were obliged to anchor at its entrance, about two o'clock P. M. and to warp in, which employed us till night. We were no sooner within the harbour, than our ships were surrounded with canoes, filled with the natives, who brought a supply of fruit and hogs, which they exchanged for our commodities. The following day, the Resolution was moored close to the northern shore, at the entrance of the harbour, and the Discovery along side the southern shore. In the mean time, Captain Cook returned Oreo's visit, and presented that chief with a red feathered cap from Tongataboo, a shirt, a linen gown, and a few other things of less value. Oreo, and some of his friends, then accompanied him on board to dinner.

On Thursday the 6th, we landed the remainder of our live stock, set up the observatories, and carried the necessary instruments on shore. The two succeeding days, Captain Cook, Mr. King, and Mr. Bayley, observed the sun's azimuths, both on shore and aboard, with all the compasses, in order to discover the variation. Nothing remarkable happened, till very early in the morning of Thursday, the 13th, when a sentinel, at the observatory, named John Harrison, deserted, taking with him his musket and accoutrements. As soon as we had gained intelligence which way he was gone, a party was detached in search of him; but they returned in the evening without success. The next day the Captain applied to the chief concerning this affair, who promised to send a party of the islanders after the fugitive, and gave us hopes that he should be brought back in the course of that day. This, however, did not happen; and we had reason to imagine, that the chief had taken no steps to find him. At this time a considerable number of the natives were about the ships, and several thefts committed, the consequences of which being apprehended by them, very few came to visit us the next morning. Oreo himself caught the alarm, and fled with his whole family. Captain Cook considered this as a good opportunity to insist upon their delivering up the deserter; and having heard he was at a place called Hamoa, situate on the other side of the island, he repaired thither with two armed boats, attended by a native. In our way, we met with the chief, who embarked with us. The Captain, with a few of his men, landing about a mile and a half from the spot, marched up to it with great expedition, lest the sight of the boats should give the alarm, and allow the offender sufficient time to escape to the mountains. This precaution proved unnecessary; for the natives of that part of the island having obtained information of the Captain's approach, were prepared to deliver the deserter. He was found with his musket lying before him, seated betwixt two women, who, the instant that the Captain entered the house, rose up to plead in his vindication. As such proceedings deserved to be discouraged, the Captain with a stern look, bid them be gone; upon which they burst into tears, and retired. Paha, the chief of that district, now came with a sucking pig, and a plantain-tree, which he was on the point of presenting to Captain Cook, as a peace-offering, who rejected it; and having ordered the chief to quit his presence, embarked with Harrison in one of the boats, and returned to the ships. After this, harmony was speedily restored. The delinquent made no other excuse for his conduct, than that the natives had enticed him away; which perhaps was in a great measure true, as Paha, and the two women above-mentioned, had been at the ship the day before his desertion. As he had remained upon his post till within a few minutes of time in which he was to have been relieved by another, the punishment he received was not very severe. About a fortnight after we had arrived at Ulietea, Omiah dispatched two of his people in a canoe, with intelligence, that he continued undisturbed by the inhabitants of Huaheine, and that every thing succeeded with him, except that his goat had died in kidding. This information was accompanied with a request, that Captain Cook would send him another goat, and also two axes. Pleased with this additional opportunity of

serving his friend, the Captain sent back the messenger to Huaheine, on the 18th, with the axes, and a male and female kid. On Wednesday, the 19th, our commander of his Majesty's ship, the *Resolution*, delivered to Captain Clerke his instructions how to proceed in case of separation, after quitting these islands, of which the following is, we believe, a true copy.

Instructions delivered by Captain James Cook, to Captain Charles Clerke, Commander of his Majesty's ship, the Discovery, Wednesday the 19th of November, 1777.

"WHEREAS the passage from the Society Islands, to the northern coast of America, is of considerable length, both in distance and in time, and as a part of it must be performed in the very depth of winter, when gales of wind and bad weather must be expected, and may possibly occasion a separation, you are to take all possible care to prevent this. But if, notwithstanding all our care to keep company, you should be separated from me, you are first to look for me where you last saw me. Not seeing me in five days, you are to proceed (as directed by the instructions of their lordships, a copy of which you have already received) for the coast of New Albion; endeavouring to fall in with it in the latitude of 45 deg. In which, and at a convenient distance from land, you are to cruize for me ten days. Not seeing me in that time, you are to put into the first convenient port, in, or to the north of that latitude, to recruit your wood and water, and to procure refreshments. During your stay in port, you are constantly to keep a good look-out for me. It will be necessary, therefore, to make choice of a station, situated as near the sea coast as possible, the better to enable you to see me, when I may appear in the offing. Should I not join you before the 1st of next April, you are to put to sea, and to proceed northward to the latitude of 56 deg. in which, and at a convenient distance from the coast, never exceeding 15 leagues, you are to cruize for me till the 10th of May. Not seeing me at that time, you are to proceed northward, and endeavour to find a passage into the Atlantic Ocean, through Hudson's or Baffin's Bays, as directed by the above-mentioned instructions.

"But if you should fail in finding a passage through either of the said Bays, or by any other way, as the season of the year may render it unsafe for you to remain in high latitudes, you are to repair to the harbour of St. Peter and St. Paul, in Kamptschatka, in order to refresh your people, and to pass the winter. Nevertheless, if you find, that you cannot procure the necessary refreshments, at the said port, you are at liberty to go where you shall think proper; taking care before you depart to leave with the governor an account of your intended destination, to be delivered to me upon my arrival: and in the spring of the ensuing year, 1779, you are to repair back to the above-mentioned port, endeavouring to be there by the 10th of May, or sooner. If on your arrival, you receive no orders from, or account of me, so as to justify your pursuing any other measures than what are pointed out in the before mentioned instructions, your future proceedings are to be governed by them. You are also to comply with such parts of the said instructions, as have not been executed, and are not contrary to these orders. And in case of your inability, by sickness, or otherwise, to carry these, and the instructions of their lordships into execution, you are to be careful to leave them with the next officer in command, who is hereby required to execute them in the best manner he can."

On Monday the 24th, in the morning, Mr. M——, midshipman, and the gunner's mate, two of the *Discovery's* people, were missing. They had embarked in a canoe, with two of their Otaheitean misses, the preceding night, and were now at the other end of the island. As the midshipman had expressed a desire of continuing at one of the Society Islands, it was extremely probable, that he and his companion had gone off with that intent. Captain Clerke therefore, with two armed boats, and a detachment of marines, set

out in quest of the fugitives, but returned in the evening without success. From the behaviour of the islanders, he was of opinion, that they intended to conceal the deserters; and, with this view had deceived him with false information, directing him to seek for them where they could not be found. He was not mistaken; for, the next morning, intelligence was brought, that the two runaways were in the isle of Otaha, with a view to continue their course to Otaheite, as soon as they had furnished themselves with provisions for the voyage. These not being the only persons in the ships who were desirous of remaining at these favourite islands, it was necessary, in order to give an effectual discouragement to any further desertion, to recover them at all events. Captain Cook, therefore, determined to go in pursuit of them himself, having observed that the natives seldom attempted to amuse him with false information. He accordingly set out with two armed boats, accompanied by Oreo himself. They proceeded, without stopping at any place, till they came to the eastern side of Otaha, where they put ashore; and the chief dispatched a man before him, with orders to seize the fugitives, and keep them till the Captain and his attendants should arrive with the boats: but when arrived at the place where they expected to find them, they were informed, that they had quitted the island, and proceeded to Bola-bola the day before. The Captain, not chusing to follow them thither, returned to the ships, with a full determination to have recourse to a measure, which he had reason to believe would compel the natives to restore them. On Wednesday the 26th, soon after day-break, Oreo, with his son, daughter, and son-in-law, having come on board the *Resolution*, the Commodore resolved to detain the three last, till our deserters should be delivered up. With this view Captain Clerke invited them on board his ship; and, as soon as they had entered his cabin, a sentinel was placed at the door, and the window secured. This proceeding greatly surprized them; and Captain Clerke having explained the reason of it, they burst into tears, and begged he would not kill them. He protested he would not, and that the moment his people were brought back, they should be released. This, however, did not remove their uneasy apprehensions, and they bewailed their expected fate in silent sorrow. The chief being with Captain Cook when he received intelligence of this affair, mentioned it immediately to him, imagining that this step had been taken without his knowledge and approbation. The Captain instantly undeceived him; and then he began to entertain a fear with respect to his own personal safety, and his countenance indicated the greatest perturbation of mind: but the Captain soon quieted his fears, by telling him, that he was at liberty to quit the ship whenever he chose, and to take such steps towards the recovery of our two men, as he should judge best calculated for that purpose; and that, if he should meet with success, his friends, on board the *Discovery*, should be released from their confinement: if not, that they should be carried away with us. The Captain added, that the chief's conduct, as well as that of many of his countrymen, in not only assisting these two men in making their escape, but in endeavouring, at this very time, to prevail upon others to follow them, would justify any measure that should serve to put a stop to such proceedings. All this was done, as we have already hinted, to interest the people of the island in the pursuit after the fugitives, and, to this end, the Captain promised a reward of large axes, and other valuable articles, to any of the natives who should be instrumental in apprehending and bringing them back. The confinement of part of the royal family might seem hard usage, yet it had its effect, and without this steady resolute proceeding the deserters would never have been recovered. The boats of the *Discovery* went day after day to all the adjoining islands, without being able to learn the least trace of them; and this they continued, till having searched every island within the distance of two days sail, they were obliged to give over any farther search, as fruitless. The explanation of the motives upon which Captain Cook acted, seemed to re-

move, in a great degree, that general consternation into which Oreo, and his people present, were at first thrown. But, though relieved from all apprehensions with regard to their own safety, they were still under the deepest concern for the prisoners in the *Discovery*. Numbers of them went under the stern of the ship, in canoes, and lamented their captivity with long and loud exclamations. The name of Poedooa (which was that of Oreo's daughter) resounded from every quarter; and the women not only made a most dismal howling, but struck their bosoms, and cut their heads with sharks teeth, which occasioned a considerable effusion of blood.

The chief now dispatched a canoe to Bolabola, with a message to Opoony, king of that island, informing him of what had happened, and requesting him to seize the two deserters, and send them back. The messenger, who was the father of Oreo's son-in-law Pootoe, came to receive the Captain's commands before his departure; who strictly enjoined him not to return without the fugitives, and to tell Opoony, from him, that, if they had left the isle of Bolabola, he must send canoes in pursuit of them. But the impatient natives, not thinking proper to trust to the return of our people for the release of the prisoners, were induced to meditate an attempt, which, if it had not been prevented, might have involved them in still greater distress. Between five and six o'clock, Captain Cook, who was then on shore, abreast of the ship, observed all their canoes, in and about the harbour, began to move off. He enquired, in vain, for the cause of this; till some of our people, calling to us from the *Discovery*, informed us, that a body of the islanders had seized Captain Clerke and Mr. Gore, as they were walking at a small distance from the ships. The Commodore, struck with the boldness of this scheme of retaliation, which seemed to counteract him in his own way, instantly commanded his people to arm; and, in a few minutes, a strong party, under the conduct of Mr. King, were sent to the rescue of the two gentlemen. At the same time two armed boats, and a party, under Mr. Williamson, were dispatched, to intercept the flying canoes in their retreat to the shore. These detachments had scarcely gone out of sight, when intelligence arrived, which convinced us we had been misinformed; and they were immediately, in consequence of this, called in. However, it appeared from several corroborating particulars, that the natives had actually formed the design of seizing Captain Clerke; and they even made no secret in speaking of it the following day. But the principal part of the plan of their operations was to have secured the person of Captain Cook. He was accustomed to bathe every evening in the fresh water; on which occasions he frequently went alone, and was unarmed. Expecting him to go this evening, as usual, they had resolved upon seizing him, and Captain Clerke likewise, if he had accompanied him. But our Commander, after confining the chief's family, had taken care to avoid putting himself in their power; and had cautioned Captain Clerke and the officers, not to go to any considerable distance from the ships. Oreo, in the course of the afternoon, asked our Commodore, three or four times, if he would not go to the bathing place; till at length finding that the Captain could not be prevailed upon, he retired, with his people, notwithstanding all our intreaties to the contrary. Having no suspicion, at this time, of their design, Captain Cook imagined, that a sudden panic had seized them, which would be soon over. Being disappointed with respect to him, they fixed upon those whom they thought more in their power. It was a fortunate circumstance that they did not succeed in their design, and that no mischief was done on the occasion; no muskets being fired, except two or three to stop the canoes; to which firing, perhaps Captain Clerke and Mr. Gore owed their safety; but Mr. King ascribes this to the Captain's walking with a pistol in his hand,

which, he says, he once fired; at which time a party of the islanders, armed with clubs, were marching towards them, but dispersed on hearing the report of the muskets. This conspiracy was first discovered by a girl, who had been brought from Huaheine by one of our officers. Happening to overhear some of the Ulieteans say, that they would seize Captain Clerke and Mr. Gore, she immediately ran to acquaint the first of our people that she met with the design. Those who had been intrusted with the execution of the plan, threatened to put her to death, as soon as we should quit Ulietea, for disappointing them. Being aware of this, we contrived that the girl's friends should come a day or two afterwards, and take her out of the ship, to convey her to a place where she might remain concealed, till an opportunity should offer for her escaping to Huaheine.

On Thursday the 27th, the tents were struck, the observatories took down, which, with the live stock, were brought on board the ships. We then unmoored, and moved a little way down the harbour, where we anchored again. In the afternoon, the natives gathered round, and came on board our ships, as usual. One party acquainted Captain Cook, that the fugitives were found, and that in a few days they would be brought back, requesting at the same time the release of the prisoners. But the Captain paid no regard to either their information or petition; on the contrary, he renewed his threatnings, which he declared he would put in execution, if the men were not delivered up. In the succeeding night the wind blew in hard squalls, which were accompanied with heavy showers of rain. In one of these squalls, the cable whereby the *Resolution* was riding at anchor, parted; but as we had another ready to let go, the ship was quickly brought up again. On the 29th, having received no account from Bolabola, Oreo set out for that island, in search after the deserters, desiring Captain Cook to follow him, the next day, with the ships. This was the Captain's intention; but the wind prevented our getting to sea. On the 30th, about five o'clock, P. M. a number of canoes were seen, at a distance, making towards the ships; and as they approached nearer we heard them sing and rejoice, as if they had succeeded in finding what they went in search of. About six, they came so nigh, that we could discern, with our glasses, the deserters fastened together, but without their misfies. They were no sooner brought on board, than the royal prisoners were released, to the unspeakable joy of all but the two fugitives, who were under great apprehensions of suffering death. Their punishment, however, was not so severe as might have been expected. S— was sentenced to receive 24 lashes, and M— was turned before the mast, where he continued to do duty while there was little or nothing to do; but on asking forgiveness, was restored to his former station on the quarter deck. It appeared that their pursuers had followed them from one island to another from Ulietea to Otaha, from Otaha to Bolabola, from Bolabola to the little island of Too-bace, where they were found, but where we never should have looked for them, had not the natives traced them out. They were taken by Pootoe's father, in consequence of the first message sent to Opoony.

On the 1st of December, notice was given to the Otahitean misfies, that they must all prepare to depart, the ships being in readiness to leave the country, and, perhaps, never to return to the Society Islands any more. This news caused great lamentation and much confusion. They were now at a great distance from home, and every one was eager to get what she could for herself before she was parted from her beloved. Most of them had already stript their mates of almost every thing they possessed, and those who had still something in reserve led a sad life till they shared it with them. It was not till the 7th, to which time we were confined in the harbour by a contrary wind, that we could clear the ships of these troublesome gentry.

Bougainville's anchor—Reasons for purchasing it—They quit the Society Islands—Bolabola and its harbour described—Bravery of its inhabitants—Historical account of the reduction of Otaheite and Ulitea—Animals left at the above islands—Method of salting pork for the use of the ships—Curious remarks respecting Otateite and the Society Islands—Additional strictures to the former accounts of Otateite, by Mr. Anderson—Of the country in general—Productions—Natural history—Description of the natives—Their language—Diet—Liquors—Different metals—Connections between the two sexes—Their customs—System of religion—Superstitions—Traditions—An historical legend—Of the regal dignity—Distinctions of rank, and punishments—Peculiarities belonging to the adjacent islands—Their names and those of their Gods—Limits of their Navigation—The Resolution and Discovery prepare for sailing to the North, in quest of the grand and principal object of this voyage—A curious geographical and historical description of the north-west parts of North America, and of the most remarkable islands situated north of the Pacific Ocean, and in the Eastern Sea.

SUNDAY, the 7th of December, at eight o'clock A. M. we weighed and made sail with a light breeze at the north-east point. During the preceding week, we had been visited by persons from all quarters of the island, who afforded us a plentiful supply of hogs and green plantains, so that the time we remained wind-bound in the harbour was not totally lost; for green plantains are an excellent succedaneum for bread, and will keep good for two or three weeks. Besides being furnished with these provisions, we also took in plenty of wood and water. The Uliteans appeared to be in general smaller, and blacker than the natives of the adjacent islands, and seemed also less orderly, which may, perhaps, be owing to their having become subjects to the inhabitants of Bolabola. Oreo, their chief, is only a kind of deputy to the Bolabolan monarch; and the conquest seems to have diminished the number of subordinate chiefs resident among them: they are, therefore, less under the immediate eye of those whose interest it is to enforce a proper obedience. Though Ulitea is now reduced to this humiliating state of dependence, it was formerly, as we were informed, the most eminent of this group of islands, and, probably, the first seat of government, for the present royal family of Otateite derives its descent from that which ruled here before the late revolution. The dethroned king of Ulitea, whose name is Ooroo, resides at Huaheine, furnishing, in his own person, an instance not only of the instability of power, but also of the respect paid by these islanders to particular families of princely rank; for they allow Ooroo to retain all the ensigns which are appropriated by them to royalty, notwithstanding his having been deprived of his dominions. We observed a similar instance to this during our stay at Ulitea, where one of our occasional visitors was Captain Cook's old friend Oree, late chief of Huaheine. He still maintained his consequence, and was constantly attended by a numerous retinue.

We now had a brisk wind, and directed our course to Bolabola, accompanied by Oreo and others from Ulitea; and, indeed, most of the natives, except the chief, would gladly have taken a passage with us to England. Our principal reason for visiting the island of Bolabola was, to procure one of the anchors which had been left at Otateite by Monsieur Bougainville. This, we were informed, had been afterwards found by the natives there, and sent by them to Opoony, the chief of Bolabola. It was not on account of our being in want of anchors that we were anxious to get possession of it; but, having parted with all our hatchets, and other iron implements, in purchasing refreshments, we were now obliged to create a fresh assortment of trading articles, by fabricating them from the spare iron we could find on board; and even the greatest part of that had been already expended. Captain Cook, therefore, supposed Mons. Bougainville's anchor would in a great measure supply our want of this useful material; and he did not entertain a doubt that Opoony might be induced to part with it. At sun-set being off the south point of Bolabola, we shortened sail, and passed the night making short boards. On Monday, the 8th, at day-break, we made sail for the harbour, on the west side of the island. Having a

scanty wind we were obliged to ply up; and it was nine o'clock before we were near enough to fend away a boat to sound the entrance. When the master returned with the boat, he reported, that the entrance of the harbour was rocky at the bottom, but that there was good ground within; and the depth of water twenty-five and twenty-seven fathoms. In the channel, he said, there was room enough to turn the ships, it being one third of a mile broad. Upon this information, we attempted to work the ships in; but the wind and tide being against us, we made two or three trips, and found it could not be accomplished till the tide should turn in our favour. Whereupon the Captain gave up the design of carrying the ships into the harbour; and, embarking in one of the boats, attended by Oreo and his companions, was rowed in for the island. As soon as they landed, our Commodore was introduced to Opoony, surrounded by a vast concourse of people. The necessary compliments being exchanged, the Captain requested the chief to give him the anchor; and, by way of inducement, produced the present he intended for him. It consisted of a linen night gown, gauze handkerchiefs, a shirt, a looking-glass, some beads, toys, and six axes. Opoony, however, refused to accept the present till the Commodore had received the anchor; and ordered three persons to go and deliver it to him, with directions to receive from him what he thought proper in return. With these messengers we set out in our boats for a neighbouring island, where the anchor had been deposited, but it was neither so large nor so perfect, as we expected. By the mark that was upon it, we found it had originally weighed seven hundred pounds, but it now wanted the two palms, the ring, and part of the shank. The reason of Opoony's refusing Captain Cook's present was now apparent: he, doubtless, supposed that the anchor, in its present state, was so much inferior to what was offered in exchange, that when the Captain saw it, he would be displeased. The Commodore, notwithstanding, took the anchor as he found it, and sent the whole of the present which he at first intended. This business being done, and the Captain returned on board, we hoisted in our boats, and made sail to the north. While we were thus employed, we were visited by some of the natives, who came off in three or four canoes to see the ships. They brought with them one pig, and a few cocoa-nuts. Had we remained at this island till the next day, we should probably have been supplied with plenty of provisions; and the natives would, doubtless, be disappointed when they found we were gone; but, having already a good stock of hogs and fruit on board, and not many articles left to purchase more, we had no inducement left to defer the prosecution of our voyage.

Oreavanoa, the harbour of Bolabola, situated on the west side of the island, is very capacious; and, though we did not enter it, Captain Cook had the satisfaction of being informed by those employed for the purpose, that it is a very proper place for the reception of ships. Towards the middle of this island is a lofty double-peaked mountain, which appeared to be barren on the east side, but on the west side has some trees and bushes. The lower grounds, towards the

the sea, like the other islands of this ocean, are covered with cocoa-palms and bread-fruit trees. There are many little islets that surround it, which add to the number of its inhabitants, and to the amount of its vegetable productions. Considering the small extent of Bolabola, being only 24 miles in circumference, it is remarkable that its people should have been able to conquer Ulitea and Otaha; the former being alone more than double its size. In each of Captain Cook's three voyages, the war that produced this great revolution was frequently mentioned; and as the history thereof may be an agreeable entertainment to our subscribers, we shall here give it as related by themselves.

Ulitea and Otaha had long been friends; or, as the natives express it emphatically, they were considered as two brothers, whose views and interests were the same. The island of Huaheine was also admitted as a friend, but not in so eminent a degree. Like a traitor, Otaha leagued with Bolabola, jointly to attack Ulitea; whose people required the assistance of their friends in Huaheine against these united powers. The inhabitants of Bolabola were encouraged by a prophetess, who predicted their success; and that they might rely on her prophecy, she desired that a man should be sent to a particular part of the sea, where from a great depth would arise a stone. He was accordingly sent off in a canoe to the place specified, and was going instantly to dive for the stone, when, behold, it started up spontaneously to the surface, and came immediately into his hand! All the people were astonished at the sight; the stone was deemed sacred, and deposited in the house of the Eatooa, where it is still preserved, as a proof that this prophetess was inspired with the divinity. Elevated with the hopes of victory, the canoes of Bolabola attacked those of Ulitea and Huaheine; the encounter lasted long, they being lashed strongly together with ropes; and, notwithstanding the pretended miracle, the Bolabola fleet would have been vanquished, had not that of Otaha arrived at the critical moment. The fortune of the day was now turned; victory declared in favour of the Bolabolans; and their enemies were totally defeated. Two days after, the conquerors invaded Huaheine, which they subdued, it being weakly defended, as most of its warriors were then absent. Many of its fugitives, however, having got to Otahite, there related their melancholy tale. This so affected those of their own country, and of Ulitea, whom they found in that island, that they obtained their assistance. They were furnished with only ten fighting canoes; with which inconsiderable force they effected a landing at Huaheine in the night; and, taking the Bolabola men by surprise, killed many of them, and dispersed the rest. Thus were they again, by one bold effort, possessed of their own island, which at this day remains independent, and is governed by its own chiefs. When the combined fleets of Ulitea and Huaheine were defeated, the men of Bolabola were applied to by their allies of Otaha, to be allowed an equal share of the conquests. This being refused, the alliance broke; and, during the war, Otaha was conquered, as well as Ulitea, both of which remain subject to Bolabola; the chiefs by whom they are governed, being only deputies to Opoony, the king of the islands. Such is their account of the war; and in the reduction of the two islands five battles were fought, at different places, in which great numbers were killed on each side.

We have already observed, that these people are extremely deficient in recollecting the exact dates of past events. Respecting this war, though it happened but a few years ago, we could only guess at the time of its commencement and duration, the natives not being able to satisfy our enquiries with any precision. The final conquest of Ulitea, which terminated the war, had been achieved before Captain Cook was there in 1769; but it was very apparent that peace had not been long restored, as marks of recent hostilities having been committed were then to be seen. By attending to the age of Teerectareea, the present chief of Huaheine, some additional collateral proof may be gathered.

He did not appear to be more than ten or twelve years of age, and his father, we were informed, had been killed in one of the engagements. Since the conquest of Ulitea and Otaha, the Bolabola men are considered as invincible; and their fame is so far extended, that, even at Otahite, if not dreaded, they are respected for their valour. It is asserted, they never fly from an enemy, and that they are victorious against an equal number of the other islanders. These ascribe much to the superiority of their god, who, they believed, detained us by contrary winds at Ulitea. The estimation in which the Bolabola men are held at Otahite, may be gathered from M. de Bougainville's anchor having been sent to their sovereign. The intention of transporting the Spanish bull to their island, must be ascribed to the same cause. They also had a third European curiosity, brought to Otahite by the Spaniards. This animal had been so imperfectly described by the natives, that we had been much puzzled to conjecture what it could be. Some good, however, generally springs up out of evil. When Captain Clerke's deserters were brought back from Bolabola, they told us the animal had been shewn to them, and that it was a ram. Had our men not deserted, it is probable we should never have known more about it. In consequence of this intelligence, the Captain, when he landed to meet Opoony, took an ewe with him in the boat, of the Cape of Good Hope breed, whereby a foundation is laid for a breed of sheep at Bolabola. He also left with Oro, at Ulitea, two goats, and an English boar and sow: so that the race of hogs will be considerably improved, in a few years, at Otahite, and all the neighbouring islands; and they will, perhaps, be stocked with many valuable European animals. When this is really the case, these islands will be unrivalled in abundance and variety of refreshments for the supply of future navigators. Even in their present state, they are hardly to be excelled. When the inhabitants are not disturbed by intestine broils, which has been the case for several years past, their productions are numerous and plentiful.

Had we been possessed of a greater assortment of goods, and a proper quantity of salt, we might have salted as much pork as would have been sufficient to last both ships almost a year: but we quite exhausted our trading commodities at the Friendly Isles, Otahite, and its neighbourhood. Our axes, in particular, were nearly gone, with which, alone, hogs were, in general, to be purchased. The salt that remained aboard was not more than was requisite for curing 15 puncheons of meat. The following process of curing pork has been adopted by Captain Cook in his several voyages. The hogs were killed in the evening; and, when cleaned, they were cut up; after which the bone was taken out. The meat was salted while hot, and laid in such a manner as to permit the juices to drain from it, till the next morning: it was then salted again, put into a cask, and covered with pickle. It remained, in this situation, four or five days, when it was taken out, and carefully examined; and if any of it appeared to be in the least tainted, which sometimes happened, it was separated from the rest, which was repacked, headed up, and filled with good pickle. It was again examined in about eight or ten days time, but there appeared no necessity for it, as it was generally found to be all perfectly cured. Bay and white salt mixed together answers the best, though either of them will do alone. Great care was taken that none of the large blood-vessels remained in the meat; and that not too much should be packed together at the first salting, lest those pieces which are in the middle should heat, and hinder the salt from penetrating them. In tropical climates, meat ought not to be salted in rainy sultry weather. Europeans having of late so frequently visited these islanders, they may, on that account, have been induced to breed a larger stock of hogs; knowing that, whenever we come, they may be certain of receiving what they esteem a valuable consideration for them. They daily expect the Spaniards at Otahite, and

and in two or three years time, they will doubtless expect the English there, as well as at the other islands. It is useless to assure them that you will not return, for they suppose you cannot avoid it; though none of them know or enquire the reason of your coming. It would, perhaps, have been better for the people to have been ignorant of our superiority in the accommodations and arts that make life comfortable, than, after once knowing it, to be abandoned to their original incapacity of improvement. They cannot be, indeed, restored to their former happy mediocrity, should the intercourse between us be discontinued. It is in a manner incumbent on the Europeans to pay them occasional visits (once in three or four years) to supply them with those articles, which we, by introducing, have given them a predilection for. The want of such supplies may be severely felt, when it is too late to return to their old imperfect contrivances, which they have now discarded, and despise. When the iron tools with which we furnished them are worn out, their own will be almost forgotten. A stone hatchet is now as great a curiosity among them, as an iron one was seven or eight years ago; and a chissel made of bone, or stone, is no where to be seen. Spike nails have been substituted in the room of the latter articles, and they are weak enough to imagine that their store of them is inexhaustible, for they are no longer sought after. Knives happened, at this time, to be in high estimation at Ulitea; and axes and hatchets bore unrivalled sway at all the islands. Respecting articles merely ornamental, these islanders are as capricious as the most polished European nations; for an article which may be prized to-day will be rejected to-morrow, as fashion or whim may alter. But our iron implements are so evidently useful, that they must continue to be high in their estimation. They would indeed be miserable, if they should cease to receive supplies of what appears necessary to their comfortable existence, as they are destitute of the materials, and ignorant of the art of fabricating them.

Much has already been related respecting Otaheite; which though not comprehended in the number of what we have denominated the Society Islands, yet, being inhabited by the same race of men, agreeing in the same leading features of character and manners, it was fortunate that we happened to discover this principal island before the others, as the hospitable reception we there met with, led us to make it the principal place of resort, in our successive voyages to this part of the Pacific Ocean. By our repeated visits, we have had better opportunity of knowing something about it and its inhabitants, than about the other similar, but less considerable islands in its vicinity. Of these latter, however, we have seen enough to satisfy us, that all we have observed of Otaheite may, with trifling alterations, be applied to them. During our continuance at these islands, we lost no opportunity of making astronomical and nautical observations. At Otaheite and Ulitea we particularly remarked the tide, with a view of ascertaining its grandest rise at the former place. Also, by the mean of 145 sets of observations, we determined the latitude and longitude of the three following places.

Matavai Point, at Otaheite	17° 29' 15" S. lat.	210° 22' 28" E. lon.
Owarreharbour, at Huahine	16 42 45	208 52 24
Ohamanene ditto, at Ulitea	16 45 30	208 25 22

It may be thought by some, the island of Otaheite has been already and so often accurately described, and the manners, customs, and ways of living of the inhabitants, so amply enlarged upon, in our history of former voyages, that little remains to be added: but, there are still, however, many parts of the domestic, political, and religious institutions of the natives, which, after all our visits to them, are but imperfectly understood; and we doubt not, but that the following remarks, for which we are indebted to the ingenious Mr. Anderson, and which may be considered as finishing strokes to a picture, the outlines of which have been already given, will be highly acceptable to our

numerous friends and subscribers, who, by their kind encouragement of this work, have given the strongest testimony in its favour.

"To what has been observed of Otaheite (says Mr. Anderson) in the accounts of the successive voyages of Captain Wallis, M. de Bougainville, and Captain Cook, it would, at first sight, seem superfluous to add any thing; as it might be supposed, that little could now be produced, but a repetition of what has been related before. I am, however, far from being of that opinion; and will venture to affirm, that, though a very accurate description of the country, and of the most obvious customs of its inhabitants, has been already given, especially by Captain Cook, yet much still remains untouched: that in some instances, mistakes have been made, which later and repeated observations have been able to rectify; and that, even now, we are strangers to many of the most important institutions that prevail among these people. The truth is, our visits, though frequent, have been but transient: many of us had no inclination to make enquiries; more were unable to direct the enquiries properly; and we all laboured, though not to the same degree, under the disadvantages attending an imperfect knowledge of the language of those, from whom alone we could receive any information. The Spaniards had it more in their power to surmount this bar to instruction; some of them having resided at Otaheite much longer than any other European visitors; by which superior advantage, they could not but have had an opportunity of obtaining the fullest information on most subjects relating to this island: their account of it would, probably, convey more authentic and accurate intelligence, than, with our best endeavours, any of us could possibly obtain. But, as I look upon it to be very uncertain, if not very unlikely, that we should ever have any communication from that quarter, I have here put together what additional intelligence about Otaheite, and its neighbouring islands, I was able to procure, either from Omai, while on board the Resolution, or by conversing with the other natives, while we had any intercourse, and were conversant with them.

"The wind, for the greatest part of the year, blows from between the E. S. E. and E. N. E. This is the true trade wind, or what the natives call *maarae*; and it sometimes blows with considerable force. When this happens, the weather is often cloudy, with showers of rain; but when the wind is more moderate, it is clear, settled, and serene. Should the wind veer farther to the southward, and become S. E. or S. S. E. it then blows more gently, with a smooth sea, and is called *maoai*. In these months, when the sun is nearly vertical, that is in December and January, the winds and weather are both very variable; but it frequently blows from W. N. W. or N. W. This wind, called *Toerou*, is generally attended by dark, cloudy weather, and frequently by rain. It sometimes blows strong, though generally moderate; but seldom lasts longer than six days without interruption; and is the only wind in which the people of the islands to leeward come to this, in their canoes. If it happens to be still more northerly, it blows with less strength, and is called *Era-potaia*; which they say is the wife of *Toerou*, who, according to their mythology, is a male. The wind from the S. W. and W. S. W. is still more frequent than the former, and though, in general, gentle, and interrupted by calms, or breezes from the eastward, yet it sometimes blows in brisk squalls. The weather attending it is commonly dark, cloudy, and rainy, with a close hot air; and accompanied by a great deal of thunder and lightning. It is called *Eroa*, and often succeeds the *Toerou*; as does also the *Farooa*, which is still more southerly; and, from its violence, blows down houses and trees, especially the coco-palms, from their loftiness; but it is of short duration. The natives seem not to have a very accurate knowledge of these changes, and yet pretend to have drawn some general conclusions from their effects; for when the sea has a hollow sound, and dashes slowly on the reef,

reef, they say it portends good weather; but if it has a sharp sound, and the waves succeed each other fast, that the reverse will happen.

"There is, perhaps, scarcely a spot in the universe, that affords a more luxuriant prospect than the S. E. part of the island of Otaheite. The hills are high and steep, and in many places, craggy: but they are covered to the very summits, with trees and shrubs, so that a spectator cannot help thinking, that the very rocks possess the property of producing and supporting their verdant clothing. The flat land which bounds those hills toward the sea, and the interjacent valleys also, teem with various productions that grow with the most exuberant vigour; and, at once, fill the mind of the beholder with the idea, that no place on the earth can excel this, in the strength and beauty of vegetation. Nature has been no less liberal in distributing rivulets, which are found in every valley; and as they approach the sea, often divide into two or three branches, fertilizing the flat lands through which they run. The habitations of the natives are scattered without order, upon these flats; and many of them appearing toward the shore, presented a delightful scene, viewed from our ships; especially as the sea, within the reef, which bounds the coast, is perfectly still, and affords a safe navigation, at all times, for the inhabitants, who are often seen paddling in their canoes indolently along, in passing from place to place, or in going to fish. On viewing these delightful scenes, I have often regretted my inability to transmit to those who have had no opportunity of seeing them, such a description as might, in some measure, convey an impression similar to what must be felt by every one, who has been fortunate enough to be on the spot.

"It is, doubtless, the natural fertility of the country, combined with the mildness and serenity of the climate, that renders the natives so careless in their cultivation, that, in many places, though abounding with the richest productions, the smallest traces of it cannot be observed. The cloth-plant which is raised from seeds brought from the mountains, and the ava, or intoxicating pepper, which they defend from the sun when very young, by covering them with the leaves of the bread-fruit-tree, are almost the only things to which they seem to pay any attention; and these they keep very clean. I have inquired very carefully into their manner of cultivating the bread-fruit-tree; but was always answered, that they never planted it. This, indeed, must be evident to every one who will examine the places where the young trees come up. It will be always observed, that they spring from the roots of the old ones; which run near the surface of the ground: so that the bread-fruit-trees may be reckoned those that would naturally cover the plains, supposing that the island was not inhabited, in the same manner that the white-barked-trees, found at Van Diemen's Land, constitute the forests there. And from this we may observe, that an inhabitant of Otaheite, instead of being obliged to plant his bread, will rather be under a necessity of preventing its progress; which, I suppose, is sometimes done, to give room for trees of another sort, to afford him a variety in his food. The chief of these are the cocoa-nut and plantain; the first of which can give no trouble, after it has raised itself a foot or two above the ground; but the plantain requires a little more care: for after it is planted, it shoots up, and, in about three months, begins to bear fruit; during which time it gives young shoots, which supply a succession of fruit; for the old stocks are cut down as the fruit is taken off. The products of the island, however, are not so remarkable for their variety, as great abundance; and curiosities of any kind are not numerous. Among these we may reckon a pond or lake of fresh water, at the top of one of the highest mountains, to go to, and return from which, takes three or four days. It is remarkable for its depth; and has eels of an enormous size in it; which are sometimes caught by the natives, who go upon this water in little floats of two or three wild plantain-trees fastened together. This is esteemed one of the greatest natural curiosities of the country; inasmuch, that travellers, who

come from the other islands, are commonly asked among the first questions, by their friends, at their return, if they have seen it? There is also a sort of water, of which there is only one small pond upon the island, as far distant as the lake, and to appearance very good, with a yellow sediment at the bottom: but it has a bad taste: and proves fatal to those who drink any quantity of it, or makes them break out into blotches, if they bathe in it.

"Nothing made a stronger impression, at first sight, on our arrival here, than the contrast between the robust make and dark colour of the people of Tongataboo, and a sort of delicacy and whiteness, which distinguish the inhabitants of Otaheite. It was even some time before that difference could preponderate in favour of the Otaheiteans; and then only, perhaps, because we became accustomed to them, the marks which recommended the others began to be forgotten. Their women, however, struck us as superior in every respect; and as possessing all those delicate characteristics, which distinguish them from the other sex in many countries. The beard, which the men here wear long, and the hair which is not cut so short, as is the fashion at Tongataboo, made also a great difference; and we could not help thinking, that, on every occasion, they shewed a greater degree of timidity and fickleness. The muscular appearance, so common among the Friendly Islanders, and which seems a consequence of their being accustomed to much action, is lost here, where the superior fertility of their country enables the inhabitants to lead a more indolent life; and its place is supplied by a plumpness and smoothness of the skin; which, though, perhaps, more consonant with our ideas of beauty, is no real advantage; as it seems to be attended with a kind of languor in all their motions, not observable in the others. This remark is fully verified, in their boxing and wrestling, which may be called little better than the feeble efforts of children, if compared to the vigour with which they are performed at the Friendly Islands.

"Among these people personal endowments are in great esteem, and they have recourse to several methods of improving them, according to their notions of beauty. It is a practice, in particular, especially among the Errocos, or unmarried men of some consequence, to undergo a kind of physical operation to render them fair. This is done by remaining a month or two in the house; during which time they wear a quantity of clothes, eat nothing but bread-fruit, to which they ascribe a remarkable property in whitening them. They also speak, as if their corpulence and colour, at other times, depended on their food, as they are obliged, from the change of seasons, to use different sorts at different times. Their common diet is made up of, at least, nine tenths of vegetable food; and I believe, more particularly, the Mahe, or fermented bread-fruit, which is a part of almost every meal, has a remarkable effect on them, preventing a costive habit, and producing a very sensible coolness about them, which could not be perceived in us who fed on animal food, and it is, perhaps, owing to this temperate course of life, that they have so few diseases among them. They reckon only five or six, which might be called chronic, or national disorders; among which are the dropsy, and the scfai, or indolent swellings, frequent at Tongataboo. But this was before the arrival of the Europeans; for we have added to this short catalogue a disease which abundantly supplies the place of all others, and is now almost universal. For this they seem to have no effectual remedy. The priests, indeed, give them a medley of simples; but they own that it never cures them. And yet, they allow that, in a few cases, nature, without the assistance of a physician, exterminates the poison of this fatal disorder, and a perfect recovery is produced.

"Their behaviour, on all occasions, seems to indicate a great openness, and generosity of disposition. Omiah, indeed, who, as their countryman, should be supposed rather willing to conceal any of their defects, has often said, that they are sometimes cruel in the treatment of their enemies. According to his account they torment them

The Mode of DANCING in the Island of Ulitea.

Correct representation of a MORAI, or BURIAL PLACE, in Oulitea.

them very deliberately; at one time tearing out small pieces of flesh from different parts; at another taking out the eyes; then cutting off the nose; and lastly, killing them by ripping up the belly. But this only happens on particular occasions. If cheerfulness argues a conscious innocence, one would suppose that their life is seldom sullied with crimes. This, however, I rather impute to their feelings, which, though lively, seem in no case permanent; for I never saw them in any misfortune, labour under the appearance of anxiety, after the critical moment was past. Neither does care ever seem to wrinkle their brow. On the contrary, even the approach of death does not appear to alter their usual vivacity. I have seen them when brought to the brink of the grave by disease, and when preparing to go to battle; but, in neither case, ever observed their countenances overclouded with melancholy or serious reflection. Such a disposition leads them to direct all their aims only to what can give them pleasure and ease. Their amusements all tend to excite and continue amorous passions, and their songs, of which they are immoderately fond, answer the same purpose. But as a constant succession of sensual enjoyments must cloy, we found they frequently varied them to more refined subjects, and had much pleasure in chanting their triumphs in war, and their occupations in peace; their travels to other islands, and adventures there; and the peculiar beauties, and superior advantages of their own island over the rest, or of different parts of it over other less favourite districts. This marks their great delight in music; and though they rather expressed a dislike to our complicated compositions, yet were they always delighted with the more melodious sounds produced singly on our instruments, as approaching nearer to the simplicity of their own. Neither are they strangers to the soothing effects produced by particular sorts of motion, which, in some cases, seem to allay any perturbation of mind, with as much success as music. Of this I met with a remarkable instance: for walking, one day, about Matavai point, where our tents were erected, I saw a man paddling, in a small canoe, so quickly, and looking about him with such eagerness on each side, as to command all my attention. At first, I imagined that he had stolen something from one of the ships, and was pursued; but, on waiting patiently, saw him repeat his amusement. He went out from the shore, till he was near the place where the swell begins to take its rise; and, watching its first motion very attentively, paddled before it, with great quickness, till he found that it overtook him, and acquired sufficient force to carry his canoe before it, without passing underneath. He then sat motionless, and was carried along at the same swift rate as the wave, till it landed him on the beach. Then he started out, emptied his canoe, and went in search of another swell. I could not help concluding, that this man felt the most supreme pleasure, while he was driven on, so fast and so smoothly, by the sea; especially as, though the tents and ships were so near, he did not seem in the least to envy, or even to take any notice of the crowds of his countrymen, collected to view them as objects that were rare and curious. During my stay two or three of the natives came up, who seemed to share his felicity, and always called out, when there was an appearance of a favourable swell, as he sometimes missed it, by his back being turned, and looking about for it. By them I understood, that this exercise, which is called *choroo*, was frequent among them; and they have probably more amusements of this sort, which afford them, at least, as much pleasure as skating.

The language of Otaheite, though doubtless radically the same with that of New Zealand, and the Friendly Isles, is destitute of that guttural pronunciation, and of some consonants, with which those latter dialects abound. The specimens we have already given, are sufficient to mark wherein the variation chiefly consists, and to shew, that, like the manners of the inhabitants, it has become soft and soothing. During the former voyage, I had collected a copious vocabulary, which enabled me the better to compare this dialect

with that of the other islands; and, during this voyage, I took every opportunity of improvements by conversing with Omiah before we arrived, and by my daily intercourse with the natives, while we now remained there." (In our history of Captain Cook's former voyage, we have given to the public very copious specimens of the language of Otaheite, New Zealand, &c. which we flatter ourselves will be thought sufficient for their information, amusement, and every useful purpose.) "It abounds with beautiful and figurative expressions, which were it perfectly known, would, I make no doubt, put it upon a level with many of the languages that are most in esteem for their warm and bold images. For instance; the Otaheiteans express their notions of death very emphatically, by saying, "That the soul goes into darkness; or rather into night." And if you seem to entertain any doubt, in asking the question, "If such a person is their mother?" they immediately reply, with surprise, "Yes, the mother that bore me." They have one expression, that corresponds exactly with the phraseology of the scriptures, where we read of the "yearning of the bowels." They use it on all occasions, when the passions give them uneasiness; as they constantly refer pain from grief, anxious desire, and other affections, to the bowels, as its seat; where they suppose all the operations of the mind are performed. Their language is so copious, that for the bread-fruit alone, in its different states, they have above twenty names; as many for the taro root; and about ten for the cocoa-nut. Add to this, that besides the common dialect, they often expostulate, in a kind of stanza, or recitative, which is answered in the same manner.

"Their arts are few and simple; yet, if we may credit them, they perform cures in surgery, which our extensive knowledge in that branch has not, as yet, enabled us to imitate. In simple fractures, they bind them up with splints; but if part of the substance of the bone be lost, they insert a piece of wood between the fractured ends, made hollow like the deficient part. In five or six days, the rapao, or surgeon, inspects the wound, and finds the wood partly covered with the growing flesh. In as many more days, it is generally entirely covered; after which, when the patient has acquired some strength, he bathes in the water, and recovers. We know that wounds will heal over leaden bullets; and sometimes, though rarely, over other extraneous bodies. But what makes me entertain some doubt of the truth of so extraordinary skill, as in the above-mentioned instance, is, that in other cases that fell under my own observation, they are far from being so dextrous. I have seen the stump of an arm, which was taken off, after being shattered by a fall from a tree, that bore no marks of skilful operation, though some allowance be made for their defective instruments: and I met with a man going about with a dislocated shoulder, some months after the accident, from their being ignorant of the method to reduce it; though this be considered as one of the simplest operations of our surgery. They know fractures or luxations of the spine are mortal, but not fractures of the skull; and they likewise know, from experience, in what part of the body wounds prove fatal. They have sometimes pointed out those inflicted by spears, which, if made in the direction they mentioned, would certainly have been pronounced deadly by us; and yet these people would have recovered. Their physical knowledge seems more confined, and that, probably, because their diseases are fewer than their accidents. The priests, however, administer the juices of the herbs in some cases; and women who are troubled with after-pains, or other disorders, the consequences of child-bearing, use a remedy which one would think needless in a hot country. They first heat stones, as when they bake their food; then they lay a thick cloth over them, upon which is put a quantity of a small plant of the mustard kind; and these are covered with another cloth. Upon this they seat themselves, and sweat plentifully to obtain a cure. They have no emetic medicine.

"Notwithstanding the extreme fertility of the island, a famine frequently happens, in which, it is said, many perish.

perish. Whether this be owing to the failure of some seasons, to over population, which must sometimes almost necessarily happen, or to wars, I have not been able to determine; though the truth of the fact may fairly be inferred, from the great oeconomy that they observe with respect to their food, even when there is plenty. In times of scarcity, after their bread-fruit and yams are consumed, they have recourse to various roots which grow, without cultivation, upon the mountains. The pararra, which is found in vast quantities, is what they use first. It is not unlike a very large potatoe or yam, and good when in its growing state; but, when old, is full of hard stringy fibres. They then eat two other roots; one not unlike the taro; and lastly, the ehoe. This is of two sorts; one of them possessing deleterious qualities, which obliges them to slice and macerate it in water, a night before they bake and eat it. In this respect it resembles the cassava root of the West-Indies; but it forms a very insipid, moist paste, in the manner they dress it. However, I have seen them eat it at times when no such scarcity reigned. Both this and the pararra are creeping plants; the last, with ternate leaves. Of animal food, a very small portion falls, at any time, to the share of the lower class of people; and then it is either fish, sea-eggs, or other marine productions; for they seldom or ever eat pork. The eree de hoi, (as Mr. Anderson calls the king, but which word Captain Cook writes eree rahie) is, alone, able to furnish pork every day; and inferior chiefs, according to their riches, once a week, fortnight, or month. Sometimes they are not even allowed that; for, when the island is impoverished by war, or other causes, the chief prohibits his subjects to kill any hogs; and this prohibition, we are told, is in force, sometimes, for several months, or even for a year or two. During that constraint, the hogs multiply so fast, that there are instances of their changing their domestic state, and turning wild. When it is thought proper to take off the prohibition, all the chiefs assemble at the king's place of abode; and each brings with him a present of hogs. The king then orders some of them to be killed, on which they feast; and, after that, every one returns home with liberty to kill what he pleases for his own use. Such a prohibition was actually in force, on our last arrival here; at least, in all those districts of the island that are immediately under the direction of Otoo. And, lest it should have prevented our going to Matavai, after leaving Oheitepeha, he sent a message to assure us, that it should be taken off, as soon as the ships arrived there. With respect to us, we found it so; but we made such a consumption of them, that, I have no doubt of it, it would be laid on again, as soon as we failed. A similar prohibition is also, sometimes, extended to fowls. It is also among the better sort, that the ava is chiefly used. But this beverage is prepared somewhat differently from that which we saw so much of at the Friendly Islands: for they pour a very small quantity of water upon the root here; and sometimes roast, and bake, and bruise the stalks, without chewing it previously to its infusion. They also use the leaves of the plant here, which are bruised, and water poured upon them, as upon the root. Large companies do not assemble to drink it, in that sociable way which is practised at Tongataboo. But its pernicious effects are more obvious here; perhaps, owing to the manner of preparing it; as we often saw instances of its intoxicating, or rather stupifying powers. Some of us, who had been at these islands before, were surprized to find many people, who when we saw them last, were remarkable for their size and corpulency, now almost reduced to skeletons, and, upon enquiring into the cause of this alteration, it was universally allowed to be the use of the ava. The skins of these people were rough, dry, and covered with scales, which, they say, every now and then fall off, and their skin is, as it were, renewed. As an excuse for a practice so destructive, they alledge, that it is adopted to prevent their growing too fat; but it evidently enervates them; and, in all probability shortens their days. As its effects had not been so visible, during our former visits, it is not

unlikely, that this article of luxury had never been so much abused as at this time. If it continues to be fashionable, it bids fair to destroy great numbers.

"The times of eating, at Otaheite, are very frequent. Their first meal, (or rather, as it may be called) their last, as they go to sleep after it, is about two o'clock in the morning; and the next is at eight. At eleven they dine: and again, as Omiah expressed it, at two, and at five; and sup at eight. In this article of domestic life, they have adopted some customs that are exceedingly whimsical. The women, for instance, have not only the mortification of being obliged to eat by themselves, and in a different part of the house from the men; but, by a strange kind of policy, are excluded from a share of most of the better sorts of food. They are not permitted to taste turtle, nor fish of the tunny kind, which is much esteemed; nor some particular sorts of the best plantains; and it is very seldom that even those of the first rank eat pork. The children of each sex also eat apart; and the women, generally, serve up their own victuals; for they would certainly starve, before any grown man would do them such a service. In this, as well as in some other customs relative to their eating, there is a mysterious conduct, which we could never thoroughly comprehend. When we enquired into the reasons of it, we could get no other answer, but that it is right and necessary it should be so. In other customs, respecting the females, there seems to be no obscurity; especially as to their connections with the men. If a young man and woman, from mutual choice, cohabit, the man gives the father of the girl such things as are necessary in common life, as hogs, cloth, and canoes, in proportion to the time they are together; and if he thinks that he has not been sufficiently paid for his daughter, he makes no scruple of forcing her to leave her friend, and to cohabit with another person who may be more liberal. The man, on his part, is always at liberty to make a new choice; but should his consort become pregnant, he may kill the child; and after that, either continue his connection with the mother, or leave her. But if he should adopt the child, and suffer it to live, the parties are then considered as in the married state, and they commonly live together ever after. However, it is thought no crime in the man to join a more youthful partner to his first wife, and to live with both. Their custom of changing their connections is, however, much more general than this last; and it is a thing so common, that they speak of it with great indifference. The errees are only those of the better sort, who, from their fickleness, and their possessing the means of purchasing fresh connections, are constantly roaming about; and, from having no particular attachment, seldom adopt the more settled method mentioned above. And so agreeable is this licentious manner of life to their disposition, that the most beautiful of both sexes thus commonly spend their youthful days, habituated to the practice of enormities, which would disgrace the most savage tribes; but are peculiarly shocking among a people whose general character, in other respects, has evident traces of the prevalence of humane and tender feelings. When an erree woman is delivered of a child, a piece of cloth dipped in water, is applied to the mouth and nose, which suffocates it. As in such a life, their women must contribute a very large share of its happiness, it is rather surprising, besides the humiliating restraints they are laid under with regard to food, to find them often treated with a degree of harshness, or rather brutality, which one would scarcely suppose a man would bestow, on an object for whom he had the least affection. Nothing, however, is more common, than to see the men beat them without mercy; and unless this treatment is the effect of jealousy, which both sexes, at least, pretend to be sometimes infected with, it will be difficult to account for it. It will be less difficult to admit this as the motive, as I have seen several instances where the women have preferred personal beauty to interest; though I must own, that even in these cases, they seem scarcely susceptible of those delicate sentiments, that are the result of mutual affection; and, I believe, that

that there is less platonic love in Otaheite, than in any other country.

" Their religious system is extensive, and, in many instances, singular; but few of the common people have a perfect knowledge of it; that being confined chiefly to their priests, who are pretty numerous. They do not seem to pay respect to one god as possessing pre-eminence; but believe in a plurality of divinities, who are all very powerful; and, in this case, as different parts of the island, and the other islands in the neighbourhood, have different ones, the inhabitants of each, no doubt, think that they have chosen the most eminent, or, at least, one who is invested with power sufficient to protect them, and to supply all their wants. If he should not answer their expectations, they think it no impiety to change; as has very lately happened at Tiaraboo, where, in the room of two divinities formerly honoured, Olla, god of Bolabola, has been adopted, I should suppose, because he is the protector of a people who have been victorious in war; and as, since they have made this change, they have been very successful themselves against the inhabitants of Otaheite-nooe, they impute it entirely to Olla, who, as they literally say, fights their battles. Their assiduity in serving their gods is remarkably conspicuous. Not only the whattas, or offering places of the morais, are commonly loaded with fruits and animals; but there are few houses where you do not meet with a small place of the same sort near them. Many of them are so rigidly scrupulous, that they will not begin a meal, without first laying aside a morsel for the eatooa; and we had an opportunity during this voyage, of seeing their superstitious zeal carried to a pernicious height, in the instance of human sacrifices, the occasions of offering which, I doubt, are too frequent. Perhaps, they have recourse to them when misfortunes occur; for they asked, if one of our men, who happened to be confined, when we were detained by a contrary wind, was taboo? Their prayers are also very frequent, which they chant, much after the manner of the songs in their festive entertainments. And the women, as in other cases, are also obliged to shew their inferiority in religious observances; for it is required of them, that they should partly uncover themselves, as they pass the morais; or take a considerable circuit to avoid them. Though they have no notion, that their god must always be conferring benefits, without sometimes forgetting them, or suffering evil to befall them, they seem to regard this less than the attempts of some more inauspicious being to hurt them. They tell us, that etee is an evil spirit, who sometimes does us mischief, and to whom, as well as to their good being, they make offerings. But the mischiefs they apprehend from any superior invisible agents, are confined to things merely temporal. They believe the soul to be both immaterial and immortal. They say, that it keeps fluttering about the lips during the pangs of death; and that then it ascends, and mixes with, or, as they express it, is eaten by the deity. In this state it remains for some time; after which, it departs to a certain place destined for the reception of the souls of men, where it exists in eternal night; or, as they sometimes say in twilight, or dawn. They have no idea of any permanent punishment after death, for crimes they have committed on earth; for the souls of good and bad men are eat indiscriminately by the deity; but they certainly consider this coalition with him as a kind of purification necessary to be undergone, before they enter into a state of bliss; for according to their doctrine, if a man refrain from all connection with women some months before death, he passes immediately into his eternal mansion, without such a previous union, as if already, by this abstinence, he were pure enough to be exempted from the general lot. They are, however, far from entertaining such sublime conceptions of happiness, which our religion, and, indeed, reason, gives us room to expect hereafter. The only great privilege they seem to think they shall acquire by death, is immortality, for they speak of spirits being, in some measure, not totally divested of those passions which actu-

No. 63.

ated them when combined with material vehicles. Thus if souls, who were formally enemies, should meet, they have many conflicts; though it should seem, to no purpose, as they are accounted invulnerable in this invisible state. There is a similar reasoning with regard to a man and his wife when they meet. If the husband dies first, the soul of his wife is known to him on its arrival in the land of spirits. They resume their former acquaintance in a spacious house, called tourooa, where the souls of the deceased assemble to recreate themselves with the gods. She then retires with him to his separate habitation, where they remain for ever, and have an offspring, which, however, is entirely spiritual, as they are neither married, nor are their embraces supposed to be the same as with corporeal beings. Some of their notions about the deity, are extravagantly absurd. They believe, that he is subject to the power of those very spirits to whom he has given existence; and that, in their turn, they frequently eat or devour him, though he possesses the power of recreating himself. They, doubtless, use this mode of expression, as they seem incapable of conversing about immaterial things, without constantly referring to material objects to convey their meaning. And in this manner they continue the account, by saying, that, in the Tourooa, the deity enquires, if they intend, or not, to destroy him? And that he is not able to alter their determination. This is known to the inhabitants on earth, as well as to the spirits; for when the moon is in its wane, it is said, that they are then devouring their eatooa; and that, as it increases, he is renewing himself. And to this accident, not only the inferior, but the most eminent gods are liable. They also believe, that there are other places for the reception of souls after death. Thus, those who are drowned in the sea, remain there; where they think that there is a fine country, houses, and every thing that can make them happy. But what is more singular, they maintain, that not only all other animals, but trees, fruit, and even stones, have souls, which at death, or upon being consumed, or broken, ascend to the divinity, with whom they first mix, and afterwards pass into the mansion allotted to each. They imagine, that their punctual performance of religious offices procures them every temporal blessing. And as they believe, that the animating and powerful influence of the deity is every where diffused, it is no wonder that they join to this many superstitious opinions about its operations. Accordingly, they believe that sudden deaths, and all other accidents, are effected by the immediate action of some divinity. If a man only stumble against a stone, and hurt his toe, they impute it to an eatooa; so that they may be literally said, agreeable to their system, to tread on enchanted ground. They are startled, in the night, on approaching a toopapoo, where the dead are exposed, in the same manner that many of our ignorant and superstitious people are with the apprehensions of ghosts, and at the sight of a church yard; and they have an equal confidence in dreams, which they suppose to be communications either from their god, or from the spirits of their departed friends, enabling those favoured with them to foretell future events; but this kind of knowledge is confined to particular people. Omiah pretended to have this gift. He told us, that the soul of his father had intimated to him in a dream, on the 26th of July, 1776, that he should go on shore, at some place, within three days; but he was unfortunate in this first attempt to persuade us that he was a prophet; for it was the 1st of August before we got into Teneriffe. Among them, however, the dreamers possess a reputation little inferior to that of their inspired priests and priestesses, whose predictions they implicitly believe, and are determined by them in all undertakings of consequence. The priestess who persuaded Opoony to invade Ulirea, is much respected by him; and he never goes to war without consulting her. They also, in some degree, maintain our old doctrine of planetary influence; at least, they are sometimes regulated, in their public counsels, by certain appearances of the moon; particularly when lying horizontally,

tally, or much inclined on the convex part, on its first appearance after the change, they are encouraged to engage in war, with confidence of success.

"They have traditions concerning the creation, which, as might be expected, are complex, and clouded with obscurity. They say, that a goddess having a lump of mafs of earth suspended in a cord, gave it a swing, and scattered about pieces of land, thus creating Otaheite and the neighbouring islands. They have also notions of a universal creation, and of lands, of which they have now no other knowledge than what is mentioned in their traditions. Their most remote account reaches to Tatoona and Tapuppa, male and female stones or rocks, who support the mafs of land and water, or our globe underneath. These produced Totorro, who was killed, and divided into land; and, after him, Otaia and Oroo were begotten, who afterward were married, and produced first land, and then a race of gods. Otaia is killed, and Oroo marries a god, her son, called Teoraha, whom she orders to create more land, the animals, and all sorts of food, found upon the earth; as also the sky, which is supported by men called Teeferei. The spots observed in the moon, are supposed to be groves of a sort of trees which once grew in Otaheite, and being destroyed by some accident, their seeds were carried up thither by doves, where they now flourish.

"They have also many legends, both historical and religious, one of which, relative to the practice of eating human flesh, I shall give the substance of, as a specimen of their method. A long time since, there lived in Otaheite two men, called Tahecai; the only name they yet have for cannibals. None knew from whence they came, or in what manner they arrived at the island. Their habitation was in the mountains, from whence they used to issue, and kill many of the natives, whom they afterwards devoured, and, by that means, prevented the progress of population. Two brothers being determined to rid their country of such a formidable enemy, used a stratagem for their destruction, with success. These lived farther upward than the Tahecai, and in such a situation, that they could speak with them, without greatly hazarding their own safety. They invited them to accept of an entertainment, that should be provided for them, to which these readily consented. The brothers then taking some stones, heated them, and thrusting them into pieces of mahee, desired one of the Tahecai to open his mouth. On which, one of these pieces was dropped in, and some water poured down, which made a boiling or hissing noise, in quenching the stone, and killed him. They intreated the other to do the same; but he declined it, representing the consequences of his companion's eating. However they assured him, that the food was excellent, and its effects only temporary; for that the other would soon recover. His credulity was such, that he swallowed the bait, and shared the fate of the first. The natives then cut them in pieces, which they buried; and conferred the government of the island on the brothers, as a reward for delivering them from such monsters. Their residence was in the district called Whapaneenoo; and to this day there remains a bread-fruit-tree, once the property of the Tahecais. They had also a woman, who lived with them, and had two teeth of a prodigious size. After they were killed, she lived at the island Otaha, and, when dead, was ranked among their deities. She did not eat human flesh, as the men; but, from the size of her teeth, the natives still call any animal that has a fierce appearance, or is represented with large tusks, Tahecai. Every one must allow, that this story is just as natural as that of Hercules destroying the Hydra, or the more modern one of Jack, the giant killer: nor do I find, that there is any moral couched under it, any more than under most old fables of the same kind, which have been received as truths only during the prevalence of the same ignorance that marked the character of the ages in which they were invented. It, however, has not been improperly introduced, as serving to express the horror and detestation entertained here, against those who feed on human flesh. And, yet, from some

circumstances, I have been led to think, that the natives of these isles were formerly cannibals. Upon asking Omiah, he denied it stoutly; yet mentioned a fact, within his own knowledge, which almost confirms such an opinion. When the people of Bolabola, one time, defeated those of Huaheine, a great number of his kinsmen were slain. But one of his relations had, afterward, an opportunity of revenging himself, when the Bolabola men were worsted in their turn, and cutting a piece out of the thigh of one of his enemies, he broiled and eat it. I have, also, frequently considered the offering of the person's eye, who is sacrificed, and offered to the chief, as a vestige of a custom which once really existed to a greater extent, and is still commemorated by this emblematical ceremony.

"The being invested with the maro, and the presiding at human sacrifices, seem to be peculiar characteristics of the sovereign. To these, perhaps, may be added the blowing a conch-shell, which produces a very loud sound. On hearing it, all his subjects are obliged to bring food of every sort to his royal residence, in proportion to their abilities. On some occasions, they carry their veneration for his very name, to an extravagant and very destructive pitch: For if, on his accession to the maro, any words in their language be found to have a resemblance to it in sound, they are changed for others; and if any man be bold enough not to comply, and continue to use those words, not only he, but all his relations, are immediately put to death. The same severity is exercised toward those who shall presume to apply this sacred name to any animal. And, agreeably to this custom of his countrymen, Omiah used to express his indignation, that the English should give the names of prince or princess to their favourite dogs or horses. But while death is the punishment for making free with the name of their sovereign, if abuse be only levelled at his government, the offender escapes with the forfeiture of land and houses. The king never enters the house of any of his subjects, but has in every district, where he visits, houses belonging to himself. And if, at any time, he should be obliged, by accident, to deviate from this rule, the house thus honoured with his presence, and every part of its furniture, is burnt. His subjects not only uncover to him, when present, down to the waist; but if he be at any particular place, a pole, having a piece of cloth tied to it, is set up somewhere near, to which they pay the same honours. His brothers are also intitled to the first part of the ceremony; but the women only uncover to the females of the royal family: in short, they seem even superstitious in their respect to him, and esteem his person little less than sacred. And it is, perhaps, to these circumstances, that he owes the quiet possession of his dominions. For even the people of Tiaraboo allow him the same honours as his right; though at the same time, they look upon their own chief as more powerful; and say, that he would succeed to the government of the whole island, should the present reigning family become extinct. This is the more likely, as Waheia doo not only possesses Tiaraboo, but many districts of Opooreano. His territories, therefore, are almost equal, in extent, to those of Otoo; and he has, besides, the advantage of a more populous and fertile part of the island. His subjects, also, have given proofs of their superiority; by frequent victories over those of Otaheite-nooe, whom they affect to speak of as contemptible warriors, easily to be worsted, if, at any time, their chief should wish to put it to the test.

"The ranks of people, besides the eree de hoi, and his family, are the erees, or powerful chiefs; the mana-hoone, or vassals; and the teou or toutou, servants, or rather slaves. The men of each of these, according to the regular institution, form their connections with women of their respective ranks; but if with any inferior one, which frequently happens, and a child be born, it is preserved, and has the rank of the father, unless he happens to be an eree, in which case it is killed. If a woman of condition should chuse an inferior person to officiate as an husband, the children he has by her are killed: and should a toutou be caught in an intrigue with

with a woman of the blood-royal, he is put to death. The son of the *ere de hoi* succeeds his father in title and honours, as soon as he is born; but if he should have no children, the brother assumes the government at his death. In other families, possessions always descend to the eldest son; but he is obliged to maintain his brothers and sisters, who are allowed houses on his estates.

The boundaries of the several districts, into which Otaheite is divided, are generally, either rivulets, or low hills, which in many places, jut out into the sea. But the subdivisions into particular property, are marked by large stones, which have remained from one generation to another. The removal of any of these gives rise to quarrels, which are decided by arms; each party bringing his friends into the field. But if any one complain to the *ere de hoi*, he terminates the difference amicably. This is an offence, however, not common; and long custom seems to secure property here as effectually as the most severe laws do in other countries. In conformity also to ancient practice established among them, crimes of a less general nature are left to be punished by the sufferer, without referring them to a superior. In this case, they seem to think, that the injured person will judge as equitably as those who are totally unconcerned; and as long custom has allotted certain punishments of different sorts, he is allowed to inflict them, without being amenable to any other person. Thus, if any one be caught stealing, which is commonly done in the night, the proprietor of the goods may put the thief instantly to death; and if any one should enquire of him after the deceased, it is sufficient to acquit him, if he only informs them of the provocation he had to kill him. But so severe a punishment is seldom inflicted, unless the articles that are stolen be reckoned very valuable, such as breast plates, and plaited hair. If only cloth, or even hogs be stolen, and the thief escape, upon his being afterward discovered, if he promise to return the same number of pieces of cloth, or of hogs, no farther punishment is inflicted. Sometimes, after keeping out of the way for a few days, he is forgiven, or at most, gets a slight beating. If a person kill another in a quarrel, the friends of the deceased assemble, and engage the survivor and his adherents. If they conquer, they take possession of the house, lands, and goods, of the other party; but if conquered, the reverse takes place. If a manahoone kills the toutou, or slave of a chief, the latter sends people to take possession of the lands and house of the former, who flies either to some other part of the island, or to some of the neighbouring islands. After some months he returns, and finding his stock of hogs much increased, he offers a large present of these, with red feathers, and other articles, to the toutou's master, who generally accepts the compensation, and permits him to repossess his house and lands. This practice is the height of venality and injustice; and the slayer of the slave seems to be under no farther necessity of absconding, than to impose upon the lower class of people, who are the sufferers. For it does not appear, that the chief has the least power to punish this manahoone; but the whole management marks a collusion between him and his superior, to gratify the revenge of the former, and the avarice of the latter. Indeed, we need not wonder, that the killing of a man should be considered as so venial an offence among a people, who do not consider it as any crime to murder their own children. When talking to them about such instances of unnatural cruelty, and asking, whether the chiefs or principal were not angry, and did not punish them? I was told, that the chief neither could nor would interfere in such cases; and that every one had a right to do with his own child what he pleased.

Though the productions, the people, the customs and manners of all the islands in the neighbourhood, may, in general, be reckoned the same as at Otaheite, there are a few differences which should be mentioned, as this may lead to an enquiry about more material ones hereafter, if such there be, of which we

are now ignorant. With regard to the little island of Mataia, or Ofnaburgh Island, which lies twenty leagues east of Otaheite, and belongs to a chief of that place, who gets from thence a kind of tribute: there a different dialect from that of Otaheite is spoken. The men of Mataia also wear their hair very long; and when they fight, cover their arms with a substance which is beset with sharks teeth, and their bodies with a sort of shagreen, being skin of fishes. At the same time, they are ornamented with polished pearl shells, which make a prodigious glittering in the sun; and they have a very large one that covers them before, like a shield or breast-plate. But Otaheite is remarkable for producing great quantities of that delicious fruit we called apples, which are found in none of the other islands, except Eimeo. It has also the advantage of producing an odoriferous wood, called Eahoi, which is highly valued at the other isles, where there is none; nor in the south-east peninsula, or Tiaraboo, though joining it. Huaheine and Eimeo again, are remarkable for producing greater quantities of yams than the other islands. And at Mouroua there is a particular bird, found upon the hills, much esteemed for its white feathers; at which place there is also said to be some of the apples, though it be the most remote of the Society Islands from Otaheite and Eimeo, where they are produced.

Though the religion of all the islands be the same, each of them has its particular or tutelar god, whose names, according to the best information I could obtain, are enumerated in the following list.

Gods	of the	ISLES.
Tanne	-	Huaheine
Ooro	-	Ulietea
Tanne	-	Otaha
Olla	-	Bolabola
Oroo, ee wciahoo	-	Mouroua
Tamouce	-	Toobace
Taroa	-	{ Tabooymanoo, or Saunder's Island, subject to Huaheine.
Oroo hadoo	-	Eimeo
Ooroo	-	{ Otaheite and Otaheite nooe
Opoonooa and Whatootee	}	Tiaraboo
Tooboo, toobooai and Ry maraiva	}	{ Mataia or Ofnaburgh Island
Tammaree	-	The low islands eastward.

Besides the cluster of high islands from Mataia to Mouroua inclusive, the people of Otaheite are acquainted with a low uninhabited island, which they name Mopecha, and seems to be Howe's Island, laid down to the westward of Mouroua in our late charts of this ocean. To this the inhabitants of the most leeward islands sometimes go. There are also several low islands to the north-eastward of Otaheite, which they have sometimes visited, but not constantly; and are said to be only at the distance of two days sail with a fair wind. They are thus named Mataceva, Oanaa or Oannah, Taboohe, Awehee, Kaoora, Orootooa, and Otavaoo, where are large pearls.

The inhabitants of these islands come frequently to Otaheite and the other neighbouring high islands, from whose natives they differ in being of a darker colour, with a fiercer aspect, and differently punctured. I was informed, that at Mataceva, and others of them, it is the custom for the men to give their daughters to strangers who arrive among them; but the pairs must be five nights lying near each other, without presuming to proceed farther. On the sixth evening, the father of the young woman treats his guest with food, and informs his daughter, that she must that night receive him as her husband. The stranger, however, must not offer to express the least dislike, though the bedfellow allotted him be ever so disagreeable; for this is considered as an unpardonable affront, and is punished with

with death. Forty men of Bolabola, who, incited by curiosity, had roamed as far as Mataeva in a canoe, were treated in this manner; one of them having incautiously mentioned his dislike of the woman who fell to his lot, in the hearing of a boy who informed her father. In consequence of this, the Mataevans fell upon them; but these warlike people killed three times their own number, though with the loss of all their party, except five. Those hid themselves in the woods, and took an opportunity, when the others were burying their dead, to enter some houses, where, having provided themselves with victuals and water, they carried them on board a canoe, in which they made their escape; and, after passing Mataia, at which they would not touch, at last arrived safe at Eimeo. The Bolabolans, however, were sensible enough that their travellers had been to blame; for a canoe from Mataeva arriving some time after at Bolabola, so far were they from retaliating upon them for the death of their countrymen, that they acknowledged they had deserved their fate, and treated their visitors with much hospitality. These low isles are, doubtless the farthest navigation, which those of Otaheite, and the Society Islands, perform at present. It seems to be a groundless supposition, made by Monf. de Bougainville, by whom we are told, that these people sometimes navigate at the distance of more than three hundred leagues. I do not believe they make voyages of this prodigious extent; for it is reckoned a sort of prodigy, that a canoe, once driven by a storm from Otaheite, should have fallen in with Mopecha, or Howe's Island, though so near, and directly to leeward. The knowledge that they have of other distant islands is, no doubt, traditional; and has been communicated to them by the natives of those islands, driven accidentally upon their coasts, who, besides giving them the names, could easily inform them of the direction in which the places lie from whence they came, and of the number of days they had been upon the sea. In this manner, it may be supposed, that the natives of Wateo have increased their catalogue by the addition of Otaheite, and its neighbouring isles, from the people we met with there, and also of the other islands these had heard of. We may thus account for that extensive knowledge attributed, by the gentlemen of the Endeavour, to Tupia, in such matters. And, with all due deference to his veracity, I presume that it was, by the same means of information, that he was able to direct the ship to Oheeroa, without having ever been there himself, as he pretended; which, on many accounts, is very improbable." Here ends Mr. Anderson's strictures on Otaheite, and its neighbouring islands.

One year and five months had now elapsed, since our departure from England; during which period we had not been, upon the whole, unprofitably employed. Captain Cook was sensible, that, with respect to the principal object of his instructions, our voyage might be considered, at this time, as only at its commencement; and therefore, his attention to whatever might contribute towards our safety and final success, was now to be exerted, as it were, anew. We had, with this view, examined into the state of our provisions at the islands we had last visited; and having now, on leaving them, proceeded beyond the extent of former discoveries, an accurate survey was ordered to be taken of all the stores that were in each ship, that, by being fully informed of the quantity and condition of every article, we might know how to use them to the greatest advantage. We had also, before we had quitted the Society Isles, taken every opportunity of enquiring of the natives, whether there were any islands situate in a northerly or north-westerly direction from them, but it did not appear that they knew of any.

We should now proceed with the progress of the voyage, after our leaving the Society Islands; but shall defer it for the commencement of the next chapter; in order to lay before our readers an historical and geographical account of the north-west parts of North America, beginning from the isthmus of Darien: also an account of the most remarkable islands situated in

the high latitudes, which, with the descriptions already given, in the course of this work, of several islands in the Indian seas, will form a complete, full, and perfect history of all the places, old and new discoveries, mentioned and touched at, by all our most celebrated circumnavigators: for which account, we acknowledge ourselves chiefly indebted to that much admired and approved work, MILLAR'S NEW and UNIVERSAL SYSTEM of GEOGRAPHY, now publishing in eighty weekly numbers, price only Sixpence each, embellished with Copper-plates; and may be had of the Publisher, Mr. Hogg, in Paternoster-row, or of any Bookseller, Newsvender, or Stationer, in Great-Britain, Ireland, &c.

Americus Vesputio, a Florentine by birth, being in 1497, sent to improve the discoveries made in 1491, by Columbus gave to the fourth quarter of the world the name of America. This vast continent, (at least what has hitherto been discovered) reaches from latitude 78 deg. N. to 56 deg. S. That is 134 degrees, which, taken in a straight line, amount to upwards of 8040 miles in length. Its breadth is very irregular, being in some places 3690 miles, and in others, as at the distance of Darien or Panama, not above 60 or 70. The boundaries ascribed to it, are the land about the pole on the north; Atlantic Ocean, which separates it from Europe and Asia on the east; another vast ocean on the south, and the Pacific Ocean, usually called the South Sea, which divides it from Asia on the west. How or when America was first peopled, cannot be ascertained; but it is most likely to have been from the north of Asia; for the natives of both these parts still bear a great resemblance to one another in many respects. North America, which constitutes a grand division of this vast continent, and of which we propose now to treat, is separated from the southern part by the isthmus of Darien, and extends from that isthmus to within a few degrees of the north pole. In the period of more than two centuries and a half, geographers were not able to ascertain the limits of the northern extremity; this was a task to be performed by Captain Cook in his third and last voyage.

Old Mexico, or New Spain, a rich and extensive country, was once a mighty empire, ruled by its own monarchs, till the Spaniards, by whom it was at first discovered, in 1598, afterwards conquered it, under the command of Fernando Cortez. It lies between seven degrees thirty minutes, and thirty degrees forty minutes north latitude, is 2000 miles long, 600 broad where widest, has the isthmus of Darien on the south, New Mexico on the north, the gulph of Mexico on the east, and the Pacific Ocean on the west. It is divided into the audiences of Guadalajara, Mexico, and Guatimala, and is governed by a viceroy. Mexico, considering its situation in the torrid zone, enjoys a temperate air. No country under heaven abounds more with grain, delicious fruits, roots, and vegetables. On the western coast, near the Pacific Ocean, are some high mountains, most of which are said to be volcanoes. Several rivers rise in these mountains, and fall, some into the gulph of Mexico, and some into the South Sea, on both which there are several capes and bays. In the rocky, barren parts of the country are the gold and silver mines. There are, it is said, several of the former, and no fewer than one thousand of the latter. Gold is also found in grains or dust, in the sands of rivers or torrents. Whoever discovers a mine of gold or silver, is at liberty to work it, paying the king a tenth of the produce, and limiting himself within fifty yards round the place upon which he has fixed. All the silver and gold dug or found in grains, is entered in the royal exchequer; and it is reported, that notwithstanding great quantities are run and concealed, no less than two millions of silver marks, weighing eight ounces each, are entered yearly, out of which they coin seven hundred thousand marks into pieces of eight, quarter pieces, rials, and half-pieces, the latter being about three-pence sterling value. The trade of Spanish America has been carried on for some years past by vessels, called register ships; and the chief commodities of this country are gold, silver, exquisite marble,

marble, porphyry, jasper, precious stones, pearls, amber, ginger, tobacco, hides, tallow, salt, dying woods, drugs, balsams, honey, feathers, chocolate, cochineal, silk, sugar, cotton, wool, &c. The inhabitants are, at present, a mixed people, consisting of Indians, Spaniards, and other Europeans; the creoles, mestichoes, or issue of the Spaniards by Americans, the mestiches, or the issue of such issue; the terceroons dez Indies, or the children of the last, married to Spaniards; and the quarteroons dez Indies, whose descendants are allowed the same privileges as true Spaniards. The negroes are likewise pretty numerous, being imported from the coast of Africa for various purposes, and many of them admitted to their freedom. The issue of an European and a negro constitutes another distinction, called mulatto; besides all which there is a mixed breed of negroes and Indians, which is generally deemed the lowest rank.

The principal places are (1) Mexico, which stands in the middle of a great lake of its own name, about one hundred and seventy miles west of the gulph of Mexico. The number of inhabitants is computed at three hundred thousand; most of them live beyond their fortunes, and terminate a life of profligation in the most wretched indigence. A prodigious quantity of jewels, gold and silver plate, and toys, together with the most valuable commodities of Europe and Asia, are exposed to sale in the streets.

California, a peninsula, is the most northern of all the Spanish dominions on the continent of America. It extends from the north coasts into the Pacific Ocean, 800 miles from Cape Sebastian, in 43 deg. 30 min. north latitude, towards the south-east as far as Cape St. Lucar, in 22 degrees, 32 minutes, north latitude. The eastern coast lies nearly parallel with that of Mexico opposite to it, and the sea between is called the lake or gulph of California. Its breadth is very unequal; towards the north it is near 200 miles, but at the south extremity it tapers away, and is scarcely 50 miles over. The more southern part was known to the Spaniards soon after the discovery of Mexico; for Cortez discovered it in 1535, but they did not till lately penetrate far into it, contenting themselves with the pearl fishery there. Several kinds of fruit are produced here; there are two species of deer peculiar to this country; also a particular breed of sheep, buffaloes, beavers, or animals much resembling them, a peculiar species of wild hogs, lions, wild cats, and many other wild beasts. The horses, mules, oxen, and other quadrupeds, that have been imported hither from Spain and Mexico, multiply exceedingly. Of the two species of deer peculiar to California, that called taye by the natives is greatly esteemed, and its flesh as well tasted as venison. The coast is plentifully stocked with birds, and there is a great variety of fish in the gulph of California, the Pacific Ocean, and the rivers. Though insects swarm here, as in most hot countries, yet on account of the dryness of the soil and climate, they are neither noxious nor troublesome. There is one of the richest pearl fisheries in the world, on the coast, and there are supposed to be mines in the country. Here are two considerable rivers, namely, Rio Colorado, and Rio du Carmel, with several smaller streams, and fine ports, creeks, and roads, both on the east and west side, which is the reason of its having been so much frequented by English privateers. There are, in the heart of the country, plains of salt quite firm, and clear as crystal. A great variety of savage tribes inhabit California. Those who live on the east side of the peninsula are great enemies to the Spaniards; but in other parts, they seem to be very hospitable to all strangers. The inland country, especially towards the north, is populous. The Indians resemble those described in other parts of America.

Siberia, a part of Russian Tartary, is bounded by the Frozen Ocean on the north; by China, and the Pacific Ocean, on the east; by Tibet, Uibeck Tartary, the Caspian Sea, and Astracan Tartary, on the south; and by European Russia, on the west; and is situate between sixty and one hundred and thirty degrees of

eastern longitude, and between forty and seventy-two degrees of north latitude, being upwards of two thousand miles in length, and one thousand five hundred in breadth.

The Tobel and Irtis are the chief cities of Siberia, which running from north to south, join the Oby, the united stream falling into the Frozen Ocean, and dividing Asia from Europe: the Lena and Jenissa, which run from north to south, fall also into the Frozen Ocean: the Yamour and Argun, which divide the Russian from the Chinese dominions, whose united streams fall into the bay of Corea. There are also a great many large lakes in this vast tract of land, of which the largest are those of Baikal and Kifan.

The only part of Siberia, fit for human beings to live in, is the southern, where the soil appears to be capable of cultivation, and that it might be rendered fertile; but, for want of inhabitants, very little corn is produced. But the northern part exhibits nothing but impenetrable woods, snow-topped mountains, fens, lakes, marshes, &c. and, being exposed to the bleak winds, is quite barren and desolate. Not a bird appears to give notice of any change of season; even rooks and magpies quit these deserts, where nature becomes quite torpid. The natives are obliged to make passages through heaps of snow, and the delights of summer are not experienced here but about three months, during which short space of time the inhabitants sow rye, oats, pease, and barley; but these seldom repay the husbandman's toil. The natives are generally shut up in their cottages for nine months in the year, scarcely ever venturing out: fir-trees of considerable height bend under the weight of snow; a melancholy gloom spreads all around, and the stillness is interrupted only by the cries of some wretched travellers in sledges. To these dreary regions the czars of Muscovy banish their courtiers and other great persons, who incur their displeasure. Some are banished for a limited term of years, and others for life, with the allowance only of one penny per day, and sometimes without any allowance at all; so that, as they are sent destitute from court, these miserable exiles pass a most dreadful life. They shoot for their livelihood, and are obliged to send an annual tribute of furs to the czars, or they are most severely punished by the task-masters.

Kamtchatka. This peninsula is bounded on the east by the ocean, which separates it from America; its western boundary is Penshinka. The southern part is in 51 degrees north latitude, and in 143 degrees east longitude from London. This peninsula is divided into two parts by a chain of hills running from north to south. Its chief rivers are the Awatscha, Kamtschatka, the Teghil, and what is called the Great River. There are many extensive lakes in it.

Their spring and summer do not continue more than four months; but the latter is far from being agreeable; for as the adjacent hills are covered with snow, the air, even in the middle of summer, is sometimes pretty cold, attended with frequent rains; the winter however is not very inclement.

In many places mines of iron and copper have been discovered: the iron ore hath been found to be compact, of a yellow colour, inclining to red; and, in some parts, black metallic particles have been observed, more compact than the rest of the ore. This ore, when crude, could not be attracted by the load-stone, but, when calcined, became so in a small degree. A solid iron ore has also been discovered here, similar to that found to the south-west of Echaterinenburg: its surface was found to be covered with a yellow oker, of a reddish brown in the breakings of its solid parts. The ore, when crude, was not acted upon by the load-stone, though, after calcination, slightly attracted by it. The copper mines are like some of those produced on the Ryphean mountains, having the malachites, in the form of stalactites and statagites, in their cavities, very beautiful, and capable of being polished.

There is great choice of timber for a variety of uses in Kamtschatka, as well as abundance of shrubs of divers kinds, they have also several excellent medi-

cinal plants. Barley, oats, peas, turnips, &c. grow likewise here. The grass springs up so fast, that they have three harvests; and the blades are frequently five feet in height.

This country abounds with tame and wild fowls. The wild animals are, black and white bears, wolves, lynxes, boars, elks, and a kind of stag very much like the fallow-deer. The bear never attacks a man, unless they find him asleep, when they tear the scalp off the back part of the head, and sometimes intirely destroy him. Foxes are also very numerous, some are white, some redish-yellow; some grey, with a black streak on the back, and are much valued; the white ones, however, are also valued, as being scarcer. There are also black-chestnuts and blue-breasted foxes; and they are in general too crafty for their pursuers, their sagacity exceeding that of the other species. The opulence of the country consists in its fables and ermines; the fables which are sold at a high price, excel those found in any other part of the globe: the natives eat the flesh, and esteem it a very fine food.

Here is also found the gulo, or glutton; likewise other kinds of beaver, as the aris, rein-deer, and sayga. The natives collect themselves in companies to hunt these animals; they go at the close of the winter from the month of March to the end of April, taking provisions with them. The glutton, which hath a very fine fur, is a terrible enemy to the deer: it will dart itself from a tree upon a deer's back, and, fixing between the creature's horns, tears out his eyes: the afflicted animal, with excess of agony, falls to the ground, when the glutton strips his flesh from his bones.

Dogs are very numerous in this country: these resemble the European, and live much upon mice and fish; they scratch up the ground for the former, and seize the others from their streams. These dogs are extremely serviceable to the natives, in drawing their sledges over the snow: in the most dreadful weather, they scarce ever lose their way.

Several sorts of amphibious animals are also in Kamtschatka. One is the sea-cow, about thirty feet in length, and weighing six or seven thousand pounds, the skin of which is so hard, that scarce an hatchet or axe will penetrate it. The flesh of a young sea-cow, when properly boiled, has a good taste; the lean part is somewhat like veal, and the fat part like pork. The method of catching this animal is, by an iron hook struck into it by some men in a small vessel, then by a rope held by people on shore, the sea-cow is drawn gradually to the land, while those in the vessel cut the creature with instruments in several parts of the body, till it expires. It is not very difficult to take the sea-cow from its elements, for it seldom raises its head above the surface of the water, though its sides and back are often seen.

Sea-horses and sea-cats are also met with here: the latter have long hairs standing out on each side of their mouths like those of a cat, and they weigh from five to eight thousand pounds: their eyes are as large as a bull's, and they will fly at people in boats; even if they are blinded by stones thrown at them, they will not retire, but gnaw the very stones that are thrown; however, when once deprived of sight, there is no great danger to be apprehended from them. The male and female differ both in form and disposition; so much in form, that they might be taken for different animals; and as to disposition, the female is mild, inoffensive, and timid: as a proof of this, when an attempt is made to seize a young sea-cat, and the male, by vigorously defending it, affords the female an opportunity of taking it off in its mouth; if, in this case, the female should happen to drop it, the male abandons its adversary, and, flying directly at the female, seizes her with all imaginable fury; when the latter, by licking his paws, and shewing every kind of submission, endeavours to mitigate his rage. The seas also abound with seals, which are caught by different methods: sometimes they are taken in the water, and at other times they are killed while sleeping on the rocks. Here are whales from seven to fifteen fathoms long.

Amongst a variety of fish, here is the sterlet, which is

so much like the sturgeon, that there is scarce any difference, except that it is smaller and more delicate; it is so fat that it may be fried without oil.

Some of the birds of Kamtschatka are, eagles, hawks, pelicans, swans, geese, wigeons, ducks, cuckows, magpies, snipes, partridges, &c. A bird called the red-neck diver is very curious; it has a beautiful spot on the lower part of its neck; beneath this spot, there are feathers of a brown colour in the middle, and edged all round with white; the breast, belly, and legs, are of a very beautiful white.

Sea-fowl are very numerous on the coast of the eastern ocean, as peacocks, sea-pies, green shanks, puffins, &c. Here too are the cormorant, sea-raven, and urile.

Clouds of dragon-flies, locusts, and gnats, are sometimes seen in this country. The latter are so troublesome, that the inhabitants are obliged to veil their faces, to avoid them. The dragon-flies, forming columns, fly with incredible swiftness.

The natives of Kamtschatka inhabit the southern part of the peninsula; the northern part is inhabited by the Koreki, and the southern by the Kuriles; but the Russians call the whole country Kamtschatka, though it has several names given it from particular circumstances. The Kamtschadales are short in stature, and resemble most of the other inhabitants of Siberia, except that their faces are somewhat shorter, their mouths larger, and their cheeks fuller; they have dark hair, hollow eyes, sharp noses, and tawny complexions; the latter is said to be principally owing to the influence of the sun reflected from the snow in the spring-season, when the snow lies thick on the ground. Some of the natives, who are obliged to be in the woods, cover their faces with a kind of netting, to prevent the effects of the sun-beams darting on the snow; for the eye-sight suffers by this refraction, as well as the complexion. These people dress in deer-skins, with the fur outwards; they use also, for this purpose, the skins of dogs and other animals. They often wear two coats, the sleeves of the outer coat reaching down to the knees; they have a hood to it, which in bad weather serves to cover the head; and they adorn the back part with threads of skins, and sometimes of silks of different colours. The women wear the same sort of garments as the men, though their coat, or rather waistcoat, fits closer to their bodies, and is decorated with slips of red, blue, and yellow cloth, and sometimes ribband, or woollen list. To this waistcoat is joined a sort of petticoat coming about half way down the leg. The men wear a leather belt round them, and their legs are covered with different coloured skins; they wear seal-skin caps or hats, and sometimes a cap or hat of birch bark; some have caps of brafs plaited. The women let their hair grow much longer than the men; they plait it, and hang brafs tinkers to it: they have fur caps, that are black without, and white within. The men plait their hair, as well as the women. They never wash themselves, but live in a most beastly manner: they neither cut their nails, nor comb their hair. They eat raw flesh, carrion, stale-fish, or any thing they can get, how filthy soever it be. They live in huts under-ground, covered with grass or earth, and sometimes with the skins of the animals they have killed in the field, undressed, and yielding a not so strong stench. They place benches in their hovels, with a fire-place in one corner, and on these benches they repose themselves. Some of the huts are covered and lined with mats. These are their winter dwellings; not are their summer retreats much more elegant, except that they are built on the surface of the earth, and with rather more regularity. These, it is true, are built high on pillows, with beams thrown across them, on which a floor is fixed, with a roof rising from each side to a central point; and, indeed it is necessary that their summer habitations should be thus high, else the inhabitants would be in continual danger from the wild beasts. They eat out of bowls, or troughs, with their dogs, and never wash them afterwards.

We shall now take notice of their marriages. When a man hath met with a young woman that he likes, he engages into the service of her parents, and, after the expiration

expiration of a limited time of servitude, obtains either permission to marry her, or is dismissed with a requital for his service. If he has leave to marry, the nuptials commence immediately, and the whole ceremony consists in stripping the bride naked, whose cloaths, however, are so fast bound by straps and girdles, that he finds it no easy task to accomplish his purpose; at this crisis several women shelter and protect her from him; who, however, seeking an opportunity to find her less guarded, makes fresh efforts to undress her: but if she cries out, and her exclamations bring assistance, the women who come fall upon the man, scratching his face, tearing his hair, and otherwise roughly treating him; till the bride, shewing some concern for his situation, and the women becoming less violent in their assault, the man at length succeeds, and then retires from her, who however calls him back, and acknowledges in a soft plaintive tone, that he has conquered her. Thus the ceremony ends, and the next day the happy couple repair to the hut of the husband. In about a week afterwards they make a visit to the wife's parents, where they celebrate the marriage feast with the relations of both parties. Some of the men marry three wives, who in general live friendly together, and are never jealous. It is deemed a very capital offence in a woman to procure abortion, yet if twins are born, one of them must be destroyed. The women put their infants in a basket fastened to an elastic pole, which is easily moved with the foot, to rock them. As soon as they can stand on their legs, their mothers leave them to themselves, suffering them to roll on the ground any where; they are most commonly half naked, and begin to walk at a time when a child in Europe would not be able to stand.

These people never bury their dead, but often give them to the dogs; and say, that as the deceased are thus devoured by dogs, they will ensure to themselves a pleasant carriage in sledges drawn by fine dogs in the other world. This abominable custom, however, is not universally practised; some leaving their dead in their hut, and seek a new habitation. The apparel of the deceased person is always thrown away, from a superstitious notion, that whoever should wear it would meet with some dreadful calamity.

They travel on sledges drawn by dogs; their number is generally four, which are driven by a whip. The person in the sledge is seated on the right side of it, with his feet hanging over, and is obliged to balance himself with great care, lest the sledge should overset. Where the roads are in tolerable condition, they can travel to a great distance in a short time, carrying with them provisions, &c. They sometimes travel, in this manner, about thirty wersts, that is, upwards of twenty-three miles in a day. They hunt the bear, among other animals; on which occasion they use rackets to walk upon the snow with, arming themselves with pikes, and taking dogs with them to provoke the animal. They then wait till he comes out of his enclosure, for they would attack him to great disadvantage while he remained there; because the snow being very firm in that place, the bear would be able to avail himself of all his strength; but the instant he comes out, he sinks into the snow, and while he is striving to disengage himself, the hunters with their pikes easily destroy him. They dress their seal-skins in the following manner: they first wet and spread out the skin, and with stones fixed in wood scrape off all the fat; then they rub it with caviar, roll it together, and tread on it; they afterwards scrape it again, and repeat the first part of their process till the skin is thoroughly cleaned and soft. They prepare in the same manner skins of beaver, deer, dogs, &c. When the men are not employed in hunting, or fishing, they weave nets, and construct sledges and boats; and in the spring and summer they procure the necessaries of life, and lay up a store for the succeeding winter. The women make shoes, sew cloaths, dye skins, &c. they also make glue of the dried skins of fishes, and particularly of the whale. They use a board of dry wood to light their fires; in this board are several round holes, into one of which putting the end of a small round stick, they

roll it backwards and forwards till the wood takes fire by the friction.

The people of this country are arrant cowards, and yet seem to despise life, through an innate kind of stupidity. They never attack their enemies openly, unless compelled to it; but steal privately to their huts, and treat them most barbarously, cutting them to pieces, and even tearing out their entrails: these cruelties are exercised with triumph and shouts of joy. Whenever they hear of a foe advancing towards them, they retire to some mountain, and fortify it as strongly as possible: if there be a probability of the enemy getting the better of them, they immediately cut the throats of their wives and children, and then meet their assailants with a frantic rage, selling their lives as dear as possible. Their weapons are bows and arrows, and spears.

The religious notions of the Kamtschadales are pretty singular. They erect a sort of pillar on some plain, and cover it with a parcel of rags. Whenever they pass by this pillar, they throw at it some fish or flesh, and avoid killing any bird or beast near it. They think that woods and burning mountains are inhabited by evil spirits, whom they live in great fear of, and make them offerings; some of them have idols in their huts. They have a very imperfect idea of a supreme Being, and think he can neither dispense happiness nor misery: the name which they have for the Deity, is Kutchu. They reverence some particular animals, from which they apprehend danger, and sometimes offer fires at the holes of foxes; they implore wolves not to hurt them, and beseech amphibious animals not to overset their boats. Many of them, however, adopt the Russian manners, and condemn the customs of their country; they have been instructed by Russian missionaries in the Christian religion; and schools have been erected for their children. They strictly observe the law of retaliation: if one man kills another, the relations of the person killed destroy the murderer. They punish theft, by burning the fingers of the thief. Before the Russians conquered them, they had such frequent intestine broils, that a year rarely passed without some village being entirely ruined.

Great havock is made in this country by the small-pox. The scurvy, with the irregularities of parents, bring a variety of diseases upon their offspring, to cure which, they apply roots, herbs, &c. The manner in which these people live in their huts, and their excess of debauchery, contribute to make the venereal disease very frequent among them. They have a disorder called the fushuroh, which is a sort of scab, to which they apply the raw skin of a hare to cause a suppuration. They are likewise subject to the palsy, jaundice, boils, cancers; and other disorders.

There are three volcanoes in Kamtschatka, the first is that of Awatcha, to the northward of the bay of that name; it is a chain of mountains, the base of which is covered with trees, and extends to the bay. The middle forms a kind of amphitheatre, and the various summits which are spiral cannot be viewed without exciting the most awful ideas. They always emit smoke, but rarely fire. There was indeed a terrible eruption of smoke and cinders in the summer of the year 1737, but it only continued one day; many of the cinders weighed almost two pounds avoirdupoise. This eruption was the forerunner of a terrible earthquake, which happened on the sixth of the ensuing October, and in a quarter of an hour overturned all the tents and huts of the Kamtschadales, being accompanied by a singular ebbing and flowing of the sea, which at first rose to the height of twenty feet, then sunk, and retired to an unusual distance; it soon after rose higher than at first, and suddenly sinking again, retired so astonishingly far from the common low-water mark, that it was for a considerable time lost to the eye. At length the earthquake was repeated, the sea returned once more, and rose to the height of two hundred feet, overwhelmed the whole coast, and then finally retired, after having destroyed the goods, cattle, and many of the lives of the inhabitants, and left several lakes of salt-water in the lower grounds and adjacent fields. The second volcano issues from

some mountains situated between the river of Kamtschatka and that of Tobolski. Nothing was ever known to exhale from this but smoke, till the year 1739, when it vomited a torrent of flames, which destroyed all the neighbouring forests. The third volcano issues from the highest mountains in Kamtschatka, on the banks of the river of that name. It is environed by a cluster of lesser mountains, and the head is rent into long crevices on every side. Its greatest eruption began September 25, 1737, and continued a week, which, with an earthquake that followed, did very considerable damage. In the southern extremity of Kamtschatka there are hot springs: they form rivulets, and run almost the length of the river Ozernaya which issues from the lake Kurilsky, and then join that stream; the waters, however, have no very considerable degree of heat in them.

There is a mountain near the river Pandia, from whose summit a prodigious cataract of boiling waters run to a considerable distance; and continue boiling up to the height of a foot, till they lose themselves in several lakes, which contain a great number of islands. From this mountain the inhabitants obtain some beautiful stones, on which they set a great value, on account of their admirable variegated colours, which are merely the effects of the different powers of heat, humidity, and friction; for these stones are washed from the mountains, and are polished by the abovementioned hot and impetuous waters.

During the winter, a great quantity of fish harbours in the river of Kamtschatka. In the spring when the ice breaks, they attempt to get to the sea; but the natives watch the heads of the rivers, and take a great number of them in a kind of nets; some they dry in the summer, and lay by for their winter food; and from others they extract the fat, or oil, by means of red hot stones, which they carefully reserve for a great variety of uses.

New Albion. This vast tract of land, and all the N. W. parts of America, are put down by all our geographers, in their maps and charts, as Terra incognita, or parts intirely unknown. Sir Francis Drake, indeed, discovered a port in nearly 40 deg. N. latitude, which he entered, and where he remained five weeks. In 1603 Martin Aguilar entered a strait in latitude 45 deg. N. and another was discovered by Juan de Fuca in 1592. All the other parts of the coast, except Cape Elias in latitude 60 deg. and some land discovered by the Spaniards, have remained objects of investigation, to be explored and accurately marked by our gallant Commander, Captain Cook, whose discoveries in these parts, as high as Cape Prince of Wales, near the Arctic Circle; together with an account of his death at an island, called O-why-hee, near Kamtschatka, will be the subjects of some of the following chapters, in the continuation of this history of his third and last voyage, to which we shall now proceed.

CHAPTER X.

The Resolution and Discovery, after their departure from the Society Isles, prosecute their voyage—Christmas Island discovered, where they are supplied plentifully with fish and turtle—A Solar Eclipse observed—Two mariners lose their way on shore—A singular method of refreshing himself practised by one of these stragglers—An inscription left in a bottle—A description of Christmas Island—Three islands described—Others discovered—Their names—The whole group denominated Sandwich Islands—A complete account of their soil, productions, inhabitants, &c.—Customs of the natives agree with those of Tongataboo and Otahiti—Extent of this nation throughout the Pacific Ocean—And remarks on the useful situation of Sandwich Islands—The Resolution and Discovery proceed to the northward—Nautical observations made at Sandwich Islands—Progress of the voyage—Arrival of the two ships on the coast of America—Description of the country—Difficulties of Cape Foulweather—Stormy, and unfavourable winds—Strictures on Martin d'Aguilar's River, and fallacy of Juan de Fuca's pretended strait—The Resolution and Discovery anchor in an inlet in Hope Bay, where they are visited by numbers of the natives—An account of their behaviour—The two ships enter the sound, and moor in a commodious harbour—Various incidents and transactions, during our intercourse with the natives—Their behaviour at their villages, where we made a progress round the sound—A remarkable visit from strangers—A second visit to one of the villages—Grass purchased—Departure of the ships after an exchange of presents—Directions for sailing into the sound—Its name—A copious and entertaining description, with several curious observations, on the adjacent country, and its inhabitants—Remarks on, and specimens of the language in Nootka Sound—Astronomical and nautical remarks—A storm after leaving the sound, in which the Resolution springs a leak—The strait of Admiral de Fonte passed unexamined.

ON Monday the 8th of December, having quitted Bolabola, and the Society Isles, we steered to the northward, with the wind between N. E. and E. scarce ever having it in the S. E. point, till after we had crossed the equator; nor did we meet with any thing by which the vicinity of land was indicated, till we began, about the latitude of 8 deg. S. to see boobies, men-of-war birds, terns, tropic birds, and a few other sorts. Our longitude, at this time, we found to be 205 deg. east. In the night, between the 22nd, and 23d, we passed the line; and, on Wednesday the 24th, soon after day-break, we descried land, bearing N. E. by E. We perceived upon a nearer approach, it was one of those low islands, so frequently met with in this ocean between the tropics; that is, a narrow bank of land, inclosing a sea or lake within. In two or three places we saw some cocoa-nut trees; but the land in general has a very sterile aspect. It extended, at noon, from N. E. by E. to S. by E. half E. and distant about four miles. On the western side we found the depth of water to be from forty to fourteen fathoms, over a sandy bottom. The Captain, being of opinion that turtle might be procured at this island, resolved to examine it; accordingly, we dropped our anchors in thirty fathoms water; and a boat was immediately dispatched to search for a commodious landing place. When she returned, the

officer who had been employed in this search, reported, that he found no place where a boat could land; but that fish greatly abounded in the shoal water, without the breakers. On the 25th, being Christmas-day, two boats were sent, one from each ship, to examine more accurately whether it was practicable to land; and, at the same time, two others were ordered out, to fish at a grappling near the shore. These last returned about eight o'clock, A. M. with as many fish as weighed upwards of two hundred weight. Encouraged by this success, they were dispatched again after breakfast, and the Captain himself went in another boat to view the coast, and attempt landing, which, however, he found to be impracticable. The two boats that had been sent on the same search, returned about noon; and the master belonging to the Resolution, reported to Captain Cook, that about four or five miles to the northward, he had discovered a break in the land, and a channel into a lagoon, consequently there was a proper place for landing; and that he had found off this entrance the same soundings as we had where we now were stationed. On the strength of this report, we weighed, and, after two or three trips, anchored again over a bottom of fine dark sand, before a little island lying at the mouth of the lagoon, on each side of which is a channel leading into it, but fit only for boats; the water in the lagoon

goon itself is likewise very shallow. In the morning of the 26th, Captain Clerke was ordered to send out a boat, with an officer, to the south-east part of the lagoon, in quest of turtle; and Captain Cook went himself, with Mr. King, each in a boat, to the north-east part. It was his intention to have gone to the eastern extremity; but the wind not permitting it, he and Mr. King landed more to leeward, on a sandy flat, where they caught one turtle. They waded through the water to an island, where they found only a few birds. Captain Cook, leaving Mr. King hereto observe the sun's meridian altitude, proceeded to the land that bounds the sea toward the north-west, which he found even more barren than the last mentioned isle; but walking over to the sea-coast, he observed three turtles close to the shore, one of which he caught. He then returned on board, as did Mr. King soon afterwards. Though so few turtles were observed by these two gentlemen, we did not despair of a supply; for some of the officers of the *Discovery*, who had been ashore to the southward of the channel leading into the lagoon, had more success, and caught many. The next morning, being Saturday, the 26th, the cutter and pinnace were dispatched under the command of Mr. King, to the south-east part of the island, within the lagoon, to catch turtle; and at the same time the small cutter was sent towards the north for the same purpose. Some of Captain Clerke's people having been on shore all night, had been so fortunate as to turn upwards of forty turtles on the sand, which were this day brought on board; and, in the course of the afternoon, the party detached to the northward returned with half a dozen, and being sent back again, continued there till we quitted the island, having, upon the whole, pretty good success. Sunday, the 28th, Captain Cook, accompanied by Mr. Bailey, landed on the island situate between the two channels into the lagoon, to prepare the telescopes for observing the solar eclipse that was expected to be visible on the 30th. Towards noon, Mr. King returned with one boat, and eight turtles; seven were left behind to be brought by the other boat, whose people were employed in catching more; and in the evening the same boat conveyed them provisions and water. The next day the two boats, laden with turtle, were sent back to the ship by Williamson, who, at the same time in a message to Captain Cook, requested, that the boats might be ordered round by sea, as he had discovered a landing place on the south-east side of the island, where the greatest numbers of turtle were caught; so that, by dispatching boats thither, the trouble of carrying them over the land, as we had hitherto done, to the inside of the lagoon, would be saved.

Tuesday the 30th, two gentlemen belonging to the *Discovery* returned, who, accompanied by Simeon Woodroff, the gunner's mate, and ten seamen, had directed their course, on the 26th, to the north east quarter, in the cutter, having each man a pint of brandy, and a good quantity of water on board. About noon, they arrived at the neck of land, over which they were to travel on foot, to come at the place where the turtle were known to harbour; and where it was dangerous to attempt to approach them by sea, on account of the surf. Here they secured safely their cutter, and erected near the shore a kind of hut, to which they carried their provisions, and sat down to refresh. This done, they agreed to divide, and pursue their sport in different parties. Accordingly they set out, and before the next morning they had sent in several turtles. This they did by placing them across a couple of oars in the manner of a bier, and in keeping a man employed in conveying them from the place where they were turned, to the cutter. When they grew tired of their diversion, they repaired to the place of rendezvous; but it was some surprize to the rest, when, at nine in the morning, the two gentlemen and the gunner's mate were missing. It was concluded, that they had gone too far within land, and that they had either lost their way, or some accident had befallen them, perhaps from natives lurking se-

cretly in the woods, though none had openly appeared. Under these apprehensions, two of their mariners, Bartholomew Loreman and Thomas Trecher, were sent out in search of them, each carrying a gallon of water, with brandy, and other refreshments, in case they should meet with the gentlemen in their way. In a wild uncultivated country, over-run with bushes and close cover, the reader, who has never been bewildered, can have no idea of men's being lost in the short space of a few miles; but so, however, it happened to our gentlemen; who, invited by the mixed melody of the birds in the woods, left their people as soon as they had properly stationed them, and entered an adjoining thicket, with their guns. The sport they met with led them on till night began to close upon them; when they found themselves at a great distance from the turtles, and in the midst of a trackless cover, with nothing but tall trees to direct their return; but what was more alarming, the sun was no sooner set than a thick fog succeeded, which involved the woods in darkness, though the open beach remained clear. In vain they attempted to regain the shore; for, instead of being able to discern the trees they had marked to secure their return, they could hardly see one another at three yards distance. In this situation, they soon began to lose all knowledge of their way; and left, instead of proceeding in the right course, they should pursue a contrary direction, they agreed to sit down to rest, and for that purpose chose the first convenient spot that chance threw in their way. Though their minds were troubled, they had scarce set themselves down, when sleep got the better of anxiety, and they lay composed, till attacked by swarms of black ants (creatures more poisonous than bugs) with which they were in a manner covered when they awoke, and so disfigured and tormented with their bites and blisters, that it is hardly possible to describe their distress. Thus circumstanced, their first care was to clear themselves from these vermin by stripping themselves naked, and sweeping them off with brushes made of the wings of the birds they had killed; this done, they clothed themselves again, in order to renew their attempts to recover the shore; but all in vain. The farther they walked, as it appeared afterwards, the farther they went astray. At length, suspecting their error, they resolved to remain stationary, and each man, placing himself against an adjoining tree, endeavoured to console himself as well as he could till morning, when the appearance of the sun enabled them to judge of the course they were to pursue; but, in a trackless wilderness, how were they to make their way! The woods in many places were overgrown with thick grass and brambles reaching to their middles, and in others so thick interlocked with boughs and matted with leaves, that it was hardly possible for them to keep company, or to penetrate with their utmost efforts (when these obstructions happened) one hundred yards in as many minutes. They were now glad to abandon their game, happy if they could regain the open country with the loss of every thing about them. The shirts and trousers they had on were soon in rags, their shoes could hardly be kept on their feet, and their linen caps and handkerchiefs were rendered unserviceable, by the frequent repetition of the uses to which they had been applied. In short, no degree of distress either of body or mind, could exceed that to which these unfortunate gentlemen were now exposed. To their minds it was some alleviation, when, about ten in the morning, they heard the sound of guns fired from the ships on purpose to lead them right, supposing them to have lost their way. But this was poor comfort, when they reflected, that the ships were at a great distance, and that if they ventured to take them for their guide, they should never live to see an end to their journey. Still labouring, therefore, to advance by the sun, they at length, all at once, observed an opening, that led, as they thought, to the long-wished-for shore. The heart of man, dilated with the most exquisite joy, can only be sensible of the inexpressible pleasure which the gentlemen felt on perceiving this ray of hope. They forgot

forgot for the moment, the pains of their lacerated bodies, though all torn with briars and besmeared with blood, and comforted themselves with this dawn of deliverance; but they had still much to suffer; for when they rushed with ecstasy from the cover, and came to survey the open country, they discovered to their great mortification, that they were yet at a great distance from the neck of land, over which their people had passed; that this opening had brought them to another creek or inlet of the sea, and that they had yet to travel round a vast circle of the thicket before they could come to the bay that was even now scarce within their knowledge. On this discovery, despair had almost taken place of hope, when they heard, or thought they heard, a sound like that of a man's voice far within the thicket. This, in a short time, was answered by a sound not unlike the former, but fainter. It was then rightly conjectured that these sounds proceeded from men sent in search of them, and they all endeavoured to raise a halloo in their turn; but their throats were so parched, that with their utmost efforts they could scarce rise above a whisper. They now lamented the waste of powder, which they had fruitlessly expended during the night in making signals of distress, and rummaged their cases to muster up a single charge. This, in some measure, had the desired effect. The report was heard by one of the seamen who were in pursuit of them (as will be seen hereafter) both of whom had been struggling with equal difficulties, and toiling under greater incumbrances, without the least prospect of succeeding in their search. These men were now bewildered themselves, and hallooed to each other, as well for the sake of keeping company, as for signals to the gentlemen, should they be within hearing. By this time the day was far advanced; and partly with fatigue and for want of refreshment, the gentlemen were almost spent; they had been ever since the morning's dawn engaged in the most painful exertion of bodily strength, to extricate themselves from the labyrinth in which they had been involved, that ever men experienced, and by consequence to an equal waste of spirits, without any thing to recruit them; and now, though less entangled, they were more exposed to the heat of the sun, which brought on an intolerable thirst that was no longer supportable; they therefore, as the last resource, repaired to the nearest beach, where, to their comfort, they found a turtle, killed it, and drank the blood, in order to allay their thirst. One of them then undressed himself, and lay down for a short time in the shallow water; a singular method of refreshing himself, when fatigued. After this they took shelter in the hollow of a rock till the violent heat abated, during which time a refreshing sleep gave them some relief, and enabled them to perform a journey of three or four leagues, which, otherwise, they must have perished, before they could have accomplished. When they arrived at the hut, to their great concern, they found it deserted, and destitute of every kind of provisions; but casting their eyes towards the ships, they perceived the boats hastening to their relief. The crew, and the officer who attended them, waited at the hut, till all their provisions were expended, and, not knowing how to proceed, had repaired to the ship for a fresh supply, and fresh orders; and he was now returning fully furnished and instructed. On his arrival, he was struck with astonishment at the sight of three such miserable objects as the gentlemen and the gunner's mate appeared to be. Their cry was for grog, which was dealt to them sparingly, and they were conveyed on board to be properly taken care of. The first enquiry they made was, whether any of the ship's company had been sent after them? And being answered in the affirmative, and that they were not yet returned, they could not help expressing their doubts whether they would return; adding their wishes at the same time, that no means might be omitted to effect their recovery. Natural it is for men who have just experienced any signal deliverance, to feel poignantly for the safety of others under the same critical circumstances. It was therefore no small satisfaction, when they were

told, that every possible means would be tried for their relief; and to enable them, who were to be sent on that errand, the better to direct their search, the gentlemen described as well as they could, the place where they were heard. The evening, however, was now too far advanced, to undertake with any probability of success, their deliverance. There were now twenty of the crew (seamen and marines) who had been dispatched from on board, for recovering the gentlemen. These had orders from Captain Clerke, to traverse the thicket in a body, till they should find them either living or dead, for, till the gentlemen appeared, nothing could be concluded with certainty concerning them. The majority were of opinion, that, if they had been alive, they would certainly have returned as soon as it was dark, as they could have no motive to pursue their sport in the night; and it was by no means probable, that they should be bewildered, because they might surely have found the same way out of the cover, by which they went into it. This was very plausible; but some on board, who had sailed with Commodore Byron, and who remembered the almost impenetrable thickets in the island of Tinian, where men could not see one another in the open day, at the distance of three yards, knew well how the gentlemen might be entangled, and how hard it would fare with them if it should so happen.

Early in the morning the party, and their plan of proceeding were formed, which was to march in lines at such a distance from each other, as to be within hearing, and their rout was proposed to be towards the spot where the sound of the voices was heard by the gentlemen. After a diligent search of six hours, Bartholomew Loreman was discovered in a most miserable condition, almost blinded by the venomous bites of the vermin, added to the scorching heat of the sun, and speechless for want of something to eat. He made signs for water, and some was given him. He was moving about, but totally stupid, having no sense of danger, or of the miserable condition in which he was found. It fortunately happened, that the boats from both ships were previously sent round the point of land, and planted along the coast, as it trended, for the convenience of taking the gentlemen on board, in case they should have been found strayed to any considerable distance. Had this precaution not been observed, the man must have perished before he could have been conveyed by any other means to the place of rendezvous, and it was with the utmost difficulty that he was carried to the nearest boat. As soon as he could be brought to his speech, he said, that he had parted from his companion Trecher, in the morning, not in anger, but by reason of a difference in opinion about the way back. He said, they had travelled the day before as long as they could in search of the gentlemen without success, and that when overcome with fatigue, they sat down to refresh, and he believed, drank a little too freely of their grog, which occasioned them both to fall asleep. They were frightened when they awoke to find it night; and although they felt their faces and hands covered with vermin, the thoughts of having neglected their duty, and the dread of the consequences, so distracted their minds, that they were not sensible of any other pain. As rest was now no longer their object, they rose and wandered, they neither knew nor cared where, till day began to break upon them, and then they endeavoured to recollect their way, with a view to rejoin their companions; but, after walking and winding about, as they could find a passage through the bushes, they at last began to discover that they were going from the place of rendezvous instead of making towards it. Fatigued to the last degree with walking, and perplexed in their minds, they began to grow careless about living or dying, and in that humour sat down to lighten their burden by making an end of their grog and provisions. This they had no sooner done, than sleep again surprised them, and notwithstanding the vermin, with which they found themselves covered when they awoke, they found themselves again in the dark, and again rose up to wander about, which they continued to do as before, lamenting

menting their melancholy situation, and consulting what course to take. Several wild projects came into their heads. They had heard of Robinson Crusoe's living many years upon an uninhabited island, and why might they not live in this? But hitherto they had seen no four-footed animal, nor anything on which they could subsist, but turtle and fowls, the latter of which they had no means to attain, and they were totally unprovided with every earthly thing but what they carried about them. That scheme therefore appeared too romantic. They next thought of climbing the highest tree, to try if they could discover any hill or eminence, from whence they might take a view of the country, in order to be certain whether it was inhabited or not. This was approved by both, and Trecher mounted the loftiest tree within his reach, from whence, he said, he could discern, towards the S. W. a mountain of considerable height, and as that was the point that led to the ships, thither he proposed that they should go; but Loreman rather chose to depend upon Providence, and endeavour to regain the shore, as he judged by a report of a gun, which he thought he heard the day before, that it must lie in the direction from whence the sound proceeded, and thither he was endeavouring to make his way, till his eye-sight failed him, and he lost all sense of action. His companion, he said, who was at some distance farther in the thicket, and who did not hear the report of the gun, did not believe what he said; whereupon they agreed to part. What course Trecher took, he could not tell, but he believed to the S. W. Loreman was judged in too dangerous a way to admit of any delay: he was therefore sent off in a boat, and being put under the care of the surgeon, soon recovered.

After this detail it was debated, whether to resign Trecher to his fate, or to continue the search. The humanity of the officer who had the command of the party prevailed. In consequence of this, the whole party, in the morning, about ten o'clock, after taking some refreshment, set out to scour the thickets, and, by hallooing, beating of drums, and pursuing different courses, determined he should hear them if he were alive. It was no easy task to penetrate a trackless cover, overgrown with underwood, and abounding with insects, of which the muskatoes were the least troublesome. But numbers make that easy, which to individuals would be impracticable. They went on cheerfully at first; but before a few hours were elapsed, even the gentlemen, who were inspired by their success in killing game, began to be tired, and it was thought advisable to rest and refresh themselves during the intense mid-day heat, and to renew the pursuit after they had dined. As yet they had not been able to discover any trace or track of the man they were pursuing, though it had been agreed between Trecher and his companion, to cut boughs from the trees, as they passed along, by way of mark or guide to each other, in case of separation. This was no small discouragement; and few had any relish to renew a labour attended with so much fatigue, and so little prospect of success. The officers alone were bent on the pursuit. The men, though they were no less willing, were not equally able to endure the fatigue, and some of them were even ready to drop, before their dinner and grog had revived their spirits. The only expedient, that now remained to be tried, was, that which Trecher had hit upon, namely, to climb the highest tree that appeared in view, in order to look for the mountain, to which it was thought probable that he might direct his course. This was no sooner proposed than executed, and the high land seemed at no great distance from the place where the party had dined. It was now agreed to make the best of their way to the eminence, but this proved not so easy a task as it at first appeared to be. When they thought themselves just ready to mount, they met with a lagoon that interrupted their progress; and coasting it along, they discovered the skeleton of a creature that, by its length, appeared to be an alligator. In viewing this narrowly, something like the track of a large animal was observed to have passed it, and the high grass on the margin of the lagoon to have been fresh trodden. This

excited the curiosity of the whole party, who imagined that some monster inhabited the lagoon, against which it was prudent for them to be on their guard. The waters of the lagoon were salt as brine, and every where skirted with a kind of reed and sedge, that reached as high as a man's head, and could not be penetrated without danger from scorpions or other venomous reptiles, several of which had been seen in the bushes. All attempts therefore of succeeding by this course appeared to be labour lost, and as no other were thought more probable, it was resolved to relinquish the pursuit, and to return to the boats; but the day being already too far spent to make their return practicable before the morning, it was agreed to coast it along the lake, to endeavour to find access to the opposite hills; and this was the more easily effected, as between the sedge border and the thicket, there was an open space of unequal breadth, only sometimes intersected with patches of brambles that joined the lake, but of no great extent. Through these they made their way with little opposition till the lake appeared to deepen, when a most stubborn woody copse seemed to bid defiance to their further progress. This difficulty, however, was with much labour surmounted, and it was no sooner passed, than the lake was found to terminate, and the ground to rise. The country now began to put on a new face. The prospect which had hitherto presented nothing but a wild and almost impenetrable thicket, as they ascended the rising ground, became delightful; and when they had attained the summit of the eminence, was exceedingly picturesque. Here they determined to pass the night within a pleasant grove, which seemed to be designed by nature for a place of rest. The whole party now assembled, and orders were given by the commanding officers to erect temporary tents to shelter them from the evening damps. These tents were only boughs and leaves of trees set up tent fashion. In this service some were employed in cutting down and preparing materials, while others were busied in disposing and putting them together: some were ordered to collect fuel, and others to carry it to an adjoining hill, in order to be kindled at the close of day, and kept burning during the night, by way of signal, to let the boats know that the party were safe, and that they had not yet relinquished the search. Add to these orders, that a sentinel was to attend the fire in the night, and a watch to be regularly set and relieved to guard the tents. In the mean time, the gentlemen amused themselves by taking a view of the lagoon from the hills, and observing its extent. It is bounded on three sides by a ridge of hills, and open only to the N. W. from which quarter they had approached it. They also observed an open down to trend towards the shore, by which the low grounds were divided, and hence they concluded, that their return would be much shortened. Before night set in, the tents were completed, and the orders that had been given were carried punctually into execution; the fire was lighted; the sentinel at his station; the watch set; and the party all retired to rest. About midnight the sentinel, who attended the fire, was surprized by a four-footed monster, that had stole upon him with a slow and solemn pace, and was just ready to seize him, when he started suddenly from it, and flew down to the tents to apprize the watch. The officer on duty was presently made acquainted with the impending danger, who immediately called to their assistance the serjeant of marines, the second mate, and the armourer, the stoutest men of the party. With this reinforcement they marched up the hill in form, Mr. Hollingsby and Mr. Dixon in front, the serjeant and the sentinel in the next line, and two sailors in the rear. As they approached the fire, the sentinel, peeping from behind the armourer, beheld the monster through the smoke, as tall again as he appeared before, and desired the front line to kneel and fire; but the armourer, fearing neither devil nor monster, determined to face the enemy. He therefore advanced boldly, and looking sharply, took the monster for a man, and called to him to speak, in the usual phrase of a seaman. But what was their astonishment, when

when they beheld the very identical Thomas Trecher, of whom they had been in search so long, crawling upon all fours, for his feet were so blistered that he could not stand, and his throat so parched that he could not speak. It is hard to say which was predominant, their surprise or joy. No time, however, was lost in administering relief. Some ran to the tents to tell the news, and to bring some refreshment, while the rest strove to ease him, by supporting him in their arms. In a few minutes he was surrounded by the whole party, some eager to hear his story, and all to give him relief. The officers brought him cordials, which they administered sparingly till he was brought to his speech. He was a most affecting spectacle, blistered from head to foot by poisonous insects, whose venomous stings had caused such an intolerable itching, that his very blood was inflamed by constant rubbing. By anointing him with oil, the acrimony in some degree abated, and by frequently giving him small quantities of tea mixed with a little brandy, they brought him to his speech; but it was some days before he recovered the perfect use of his senses. As soon as they had recovered him so far, by proper refreshments, as to entertain hopes of saving his life, they carried him to bed, and ordered one of his messmates to attend him. In the morning his fever was abated; but there arose a difficulty, how he was to be conveyed more than twelve miles, through a country, such as has been described, in his weak condition. To English sailors nothing, that is not impossible, is impracticable. One of them remembered that, when he was a boy, his schoolfellows used to divert themselves with making sedan chairs of rushes, and he thought it an easy matter to frame such a one from the materials in the thicket, that would answer the purpose. This was no sooner proposed than executed, and a machine contrived, in which they took it by turns to carry him through almost insurmountable obstructions. The gentlemen had, indeed, discovered a less encumbered passage than that, through which they had made their way the day before; but it reached very little farther than they could see with the naked eye; all the low ground beyond was swampy and reedy, and abounding with insects of various kinds. In the evening, unexpectedly fatigued, they reached the beach, where the Discovery's cutter was grounded, and where likewise the Resolution's boat, that had been waiting all the day before on the opposite side of the peninsula, was arrived. After some slight refreshment, each party repaired to their own ship; and Trecher, being committed to the surgeon's care, recovered gradually, but it was some weeks before he was fit to do duty. Considering what strange people the generality of sailors are, while on shore, we might, instead of being much surprised, that the two seamen should lose their way, rather wonder that no more of them were missing.

This day, (Tuesday, the 30th) Captain Cook, and Messrs. King and Bailey, repaired in the morning to the small island, to observe the eclipse of the sun. The sky was overcast at times; but it was clear when the eclipse ended. Having some yams and cocoa-nuts on board, in a state of vegetation, we planted them on this spot, and some seeds of melons were sown in another place. The Captain also left on this little isle a bottle, having this inscription:

Georgius Tertius, Rex, 31 Decembris, 1777.

*Naves { Resolution, Jac. Cook, Pr.
Discovery, Car. Clerke, Pr.*

A. D. 1778. On Thursday the 1st of January, our boats were sent out to bring on board our different parties employed on shore, who, in the course of a week, had taken more than 100 turtle, from 150 to 300 pound weight: but we had not been able to discover any fresh water. It being late before this business was completed, the Captain thought proper to defer sailing till the next morning. The turtle we procured at this island were all of the green sort, and, perhaps, not inferior in goodness to any in the world. We also caught with hook and line, a great quantity of fish, principally consisting of cavalries, snappers, and a few rock fish of two species, one with whitish

streaks scattered about, and the other with numerous blue spots. The soil of this island, (to which the name of Christmas Island was given, because we kept that festival here,) is, in some places, light and blackish, and composed of sand, the dung of birds, and rotten vegetables. In other parts, it is formed of broken coral stones, decayed shells, and other marine productions. These are deposited in long, narrow ridges, lying parallel with the sea-coast; and must have been thrown up by the waves, though they do not reach at present, within a mile of these places. This seems to prove incontestibly, that the island has been produced by different accessions from the sea, and is in a state of augmentation; the broken pieces of coral, and likewise many of the shells, being too large and heavy to have been brought from the beach by any birds to the places where they are now lying. Though we could not, after repeatedly digging, find a drop of fresh water, we met with several salt ponds, which, as they had no communication with the sea, were probably filled by the water filtering through the sand during the time of high tides. One of the men who lost their way found some salt on the south-eastern part of the island. We could not discover the smallest traces of any human creature having ever been here before us; and, indeed, should any one be accidentally driven on the island, or left there, he would hardly be able to prolong his existence: for though there are birds and fish in abundance, there are no visible means of allaying thirst, nor any vegetable that would serve as a substitute for bread, or correct the bad effects of animal diet. On the few cocoa-nut trees upon the island, we found very little fruit, and that little not good. A few low trees were observed in some parts, besides several small shrubs and plants, which grew in a very languid manner. We found a sort of purslain, a species of fida, or Indian mallow, and another plant that seemed, from its leaves, to be a *me sembrantibennum*; with two sorts of grass. Under the low trees sat vast numbers of a new species of tern, or egg-bird, black above, and white below, having a white arch on the forehead. These birds are somewhat larger than the common noddy; their eggs are bluish, and speckled with black. There were likewise many common boobies; a sort greatly resembling a gannet; and a chocolate-coloured species, with a white belly. Men-of-war birds, curlews, plovers, and tropic birds, are to be found here. We saw numbers of land-crabs, small lizards, and several rats smaller than ours. This island is supposed by Captain Cook to be between 15 and 20 leagues in circuit. Its form is semi-circular; or like the moon in her last quarter, the two horns being the north and south points. The west side, or the small island situate at the entrance into the lagoon, lies in 202 deg. 30 min. east longitude, and in the latitude of 1 deg. 59 min. north. Like most of the other isles in this ocean, Christmas Island is surrounded by a reef of coral rock, extending but a little way from the shore; and further out than this reef, on the western side, is a bank of sand, which extends a mile into the sea. There is good anchorage on this bank, in any depth between eighteen and thirty fathom. During our continuance here, the wind generally blew a fresh gale at E. by S. or E. and we had constantly a great swell from the northward, which broke on the reef in a very violent manner.

Friday, the 2nd, at day-break, we unmoored, set sail, and resumed our northerly course, with the Discovery in company. As we were now clear of land, had a prosperous gale, and plenty of provisions, the men were allowed turtle to boil with their pork, which in a few days was discontinued by the advice of the surgeon, and turtle substituted in the room of every other kind of meat. This was found both healthful and nourishing, and was therefore continued till within a few days of our arrival at another island, where we met with fresh provisions and water equal to any we brought with us from the Society Isles. On the 3d, the wind shifted, and a storm came on, preceded by a lowering darkness, that presaged some violent convulsion, and soon after it broke forth in thunder, lightning, wind and rain,

rain, which in two hours increased to such a raging degree, as no man on board had ever known the like. Fortunately, it was but of short continuance; but, in that little time, the sea broke over our quarter, and cleared the decks of every thing that was loose. After this we had a gentle breeze at E. and E. S. E. which continued till we arrived in the latitude of 7 deg. 45 min. N. and in 205 deg. east longitude, where we had one day of perfect calm. A N. E. by E. wind then succeeded, which blew faintly at first, but freshened as we proceeded northward. We daily observed tropic birds, boobies, &c. and between the latitude of 10 and 11 deg. N. we saw several turtles. Though all these are considered as signs of the proximity of land, we discovered none till early in the morning of Sunday, the 18th, when an island appeared bearing N. E. by E. Not long after more land was seen, which bore N. and was totally detached from the former. At noon, the first was supposed to be 8 or 9 leagues distant. Our longitude at this time, was 200 deg. 41 min. E. and our latitude 21 deg. 12 min. N. The next day, at sun-rise, the island first seen bore E. distant 7 leagues. Not being able to reach this, we shaped our course for the other; and soon after, observed a third island, bearing W. N. W.

We had now a fine breeze at E. by N. and, at noon, the second island, named Atooi, for the east end of which we were steering, was about two leagues distant. As we made a nearer approach, many of the inhabitants put off from the shore in their canoes, and very readily came along-side the ships. We were agreeably surprised to find, that they spoke a dialect of the Otaheitean language. They could not be prevailed on, by any entreaties, to come on board. We conveyed to those in the nearest canoe some brass medals, tied to a rope; and they, in return, fastened some mackarel to the rope, by way of an equivalent. This was repeated; and some nails or pieces of iron, were given them; for which they returned in exchange some more fish, and a sweet potatoe; a sure indication of their having some notion of bartering, or, at least, of returning one present for another. One of them even offered for sale the piece of stuff which he wore about his waist. These people did not exceed the ordinary size, but are stoutly made. Their complexion is brown; and though there appears but little difference in the casts of their colour, there is a considerable variation in their features. Most of them have their hair cropped short; a few had it tied in a bunch at the top of the head; and others suffered it to flow loose. It seemed to be naturally black; but the generality of them had stained it with some stuff which communicated to it a brownish colour. Most of them had pretty long beards. They had no ornaments about their persons; nor did we observe that they had their ears perforated. Some of them were tattooed on the hands, or near the groin; and the pieces of cloth, worn by them round their middle, were curiously coloured with white, black and red. They seemed to be mild and good natured; and were furnished with no arms of any kind, except some small stones, which they had manifestly brought for their own defence; and these they threw into the sea when they found there was no occasion for them. Perceiving no signs of an anchoring place, at this eastern extremity of the island, we bore away to leeward, and ranged along the S. E. side of the coast, at the distance of about a mile and a half from the shore. The canoes left us when we made sail; but others came off, as we proceeded along the coast, and brought with them pigs and some excellent potatoes, which they exchanged for whatever we offered to them; and several small pigs were purchased by us for a six-penny nail each. We passed divers villages; some of which were situated near the sea, and others further up the country. The inhabitants of all of them came in crowds to the shore, and assembled on the elevated places to take a view of the ships. On this side of the island the land rises in a gentle acclivity from the sea to the bottom of the mountains, which occupy the central part of the country, except at one place near the eastern end, there they rise immediately from the sea: they seemed to be composed

of stone, or rocks lying in an horizontal strata. We observed a few trees about the villages; near which we could also discern several plantations of sugar-canes and plantains. We continued to sound, but did not strike ground with a line of 50 fathoms, till we came abreast of a low point, near the N. W. extremity of the island, where we found from 12 to 14 fathoms, over a rocky bottom. Having passed this point, we met with 20 fathoms, then 16, and at last 5, over a bottom of sand. We spent the night in standing off and on, and the next morning, being Tuesday, the 20th, stood in for the land. We were met by several canoes filled with natives, some of whom ventured to come on board. None of the inhabitants we were ever before conversant with, in any other country or island, were so astonished as these people, upon entering our ship. Their eyes were incessantly rolling from one object to another; and the wildness of their looks and gestures fully indicated their perfect ignorance with respect to every thing they beheld; and strongly marked to us, that they had never, till the present time, been visited by Europeans, nor been acquainted with any of our commodities, except iron. This metal, however, they had in all probability only heard of, or had perhaps known it in some considerable quantity, brought to them at a remote period. They asked for it by the appellation of hamaite, referring probably to some instrument, in making which iron could be serviceably employed; for they applied that name to the blade of a knife, though they had no idea of that particular instrument, which they could not even handle properly. They also frequently called iron by the name of toe, which signifies a hatchet, or adze. On our shewing them some beads, they first asked what they were; and then, whether they were to be eaten. But on their being informed, that they were to be hung in their ears, they rejected them as useless. They were equally indifferent with regard to a looking-glass that we offered them, and returned it for a similar reason. China cups, plates of earthen ware, and other things of that kind, were so new to them, that they asked whether they were made of wood. They were in many respects naturally polite; or, at least, cautious of giving offence. Some of them just before they ventured aboard, repeated a long prayer; and others, afterwards, sang, and made various motions with their hands. On their first entering the ship, they attempted to steal every thing that they could lay hands on, or rather take it openly, as if they supposed, that we should either not resent such behaviour, or not hinder it. But we soon convinced them of their error; and when they observed we kept a watchful eye over them, they became less active in appropriating to themselves what did not belong to them.

About nine o'clock, the Captain dispatched Lieut. Williamson, with three armed boats, to look out for a proper landing place, and for fresh water; with orders, that if he should find it necessary to land in search of the latter, he should not allow more than one man to accompany him out of the boats. The very moment they were putting off from the ship, one of the islanders having stolen a cleaver, leaped overboard, got into his canoe, and hastened towards the shore, while the boats pursued him in vain. The reason of the Commodore's order, that the crews of the boats should not go ashore, was, that he might prevent, if possible, the importation of a dangerous disease into this island, which he knew some of our people now laboured under, and which we, unfortunately, had received from, and communicated to, other islands in this ocean. From the same humane motive, he commanded, that all female visitants should be excluded from both the ships. Many persons of this sex had come off in the canoes. Their features, complexion, and stature, were not very different from those of the men; and though their countenances were extremely open and agreeable, few traces of delicacy were visible either in their faces or other proportions. The only difference in their dress was their having a piece of cloth about their bodies, reaching from near the middle almost down to the knees, instead of the maro worn by the male sex. They were as much inclined to favour us with their company on

board, as some of the men were; but the Commodore was extremely desirous of preventing all connection, which might, in all probability, convey an irreparable injury to themselves, and afterwards, through their means, to the whole nation. Another prudent precaution was taken, by strictly enjoining, that no person, capable of communicating the infection, should be sent on duty out of the ships. Captain Cook had paid equal attention to the same object, when he first visited the Friendly Isles; but he afterwards found, to his great regret, that his endeavours had not succeeded. And there is reason to apprehend, that this will constantly be the case, in such voyages as ours, whenever it is necessary that many people should be employed on shore. The opportunities and incitements to an amorous intercourse are then too numerous to be effectually guarded against; and however confident a commander may be of the health of his men, he is often undeceived too late. Among a number of men, there are in general to be found some, who endeavour to conceal any venereal symptoms, and there are others so profligate and abandoned, as not to care to whom they communicate this disease. We had an instance of this last observation at Tongataboo, in the gunner of the *Discovery*, who had been stationed on shore. After knowing that he had contracted this disorder, he continued to have connections with different women, who were supposed to have been, till that time, free from any infection. His companions remonstrated to him on this scandalous behaviour without effect, till Captain Clerke, being informed of it, ordered him to repair on board.

During the time the boats were employed in reconnoitering the coast, we stood off and on with the ships. Towards noon our lieutenant returned, and reported, that he had observed, behind a beach near one of the villages, a large pond, said by the natives to contain fresh water, and that there was tolerable anchoring ground before it. He also had made an attempt to land in another place, but was prevented by the islanders, who coming down in great numbers to the boats, endeavoured to take away the oars, muskets, and every other article they could lay hold of; and crowded so thick upon him and his people, that he was under the necessity of firing, by which one man was killed. This unfortunate circumstance, however, was not known to Captain Cook till after we had quitted the island, so that all his measures were directed as if no affair of that kind had happened. Mr. Williamson informed him, that as soon as the man fell, he was taken up and carried off by his countrymen, who then retired from the boats; but still they made signals for our people to land, which they declined. It did not appear, that the natives had the least intention of killing, or even hurting any of them, but were excited by curiosity alone, to get from them what they had, being prepared to give, in return, any thing that appertained to themselves. Captain Cook then dispatched one of the boats to lie in the best anchoring ground; and, when she had gained this station, we bore down with the ships, and cast anchor in 25 fathoms water, over a sandy bottom. The eastern point of the road, which was the low point already mentioned, bore south 31 deg. east; the west point north 63 deg. west; and the village near which the fresh water was said to be, was one mile distant. The ships being thus stationed, between three and four in the afternoon, the captain went ashore with three armed boats, and twelve of the marines, with a view of examining the water, and trying the disposition of the natives, who had assembled in considerable numbers on a sandy beach before the village; behind it was a valley, in which was the piece of water. The moment he leaped on shore, all the islanders fell prostrate upon their faces, and continued in that posture, till, by signs, he prevailed on them to rise. They then presented to him many small pigs, with plantain trees, making use of nearly the same ceremonies which we had seen practised, on similar occasions, at the Society, and other isles, and a long oration or prayer being pronounced by an individual, in which others of the assembly joined occasionally. The captain signified his acceptance of

their proffered friendship, by bestowing on them, in return, such presents as he had brought ashore. This introductory business being ended, he stationed a guard upon the beach, and was then conducted by some of the natives to the water, which was extremely good, and so considerable a collection, that it might be denominated a lake. After this he returned on board, and gave orders, that preparations should be made for filling our water casks in the morning, at which time we went ashore with some of our people, having a party of marines for our guard. We had no sooner landed, than a trade was entered into for potatoes and hogs, which the islanders bartered for nails and pieces of iron. Far from giving any obstruction to our men, who were occupied in watering, they even assisted them in rolling the casks to and from the pool, and performed with alacrity whatever was required of them. Leaving the command of this station to Mr. Williamson, who landed with us, we made an excursion up the country, into the valley, accompanied by Messrs. Anderson and Webber, and by a numerous train of natives, one of whom, who had been very active in keeping the others in order, the captain made choice of as our guide. This man, from time to time, proclaiming the approach of our gentlemen, every person who met them fell prostrate on the ground, and remained in that position till we had passed. This, as we were afterwards informed, is the method of shewing respect to their own chiefs. At every village, as the ships ranged along the coast, we had descried one or more elevated white objects, resembling obelisks; one of which, supposed to be at least fifty feet high, was very conspicuous from our anchoring place, and seemed to be at a small distance up this valley. To have a nearer view of it was the principal motive of our walk; but it happened to be in such a situation that we could not get at it, the pool of water separating it from us. However, as there was another of the same kind about half a mile distant upon our side of the valley, we set out to visit that. We found it to be situated in a burying ground, or morai, which bore a striking resemblance, in several respects, to those we had seen at Otaheite, and other islands. It was an oblong space, of considerable extent, environed by a stone wall, four or five feet high. The inclosed space was loosely paved, and at one end of it was placed the obelisk or pyramid, called by the natives *henananoo*, which was an exact model of the larger one we had seen from the ships. It was about twenty feet in height, and four feet square at the base. Its four sides were formed of small poles, interwoven with twigs and branches, thus composing an indifferent wicker-work, hollow within, from the top to the bottom. It appeared to be in a ruinous state, and had been originally covered with a thin greyish cloth. On each side of it were long pieces of wicker-work, termed *hereance*, in a condition equally ruinous, with two poles inclining towards each other at one corner, on which some plantains were placed on a board, fixed at the height of about six feet. This the islanders call *herairemy*, and they said the fruit was offered to their deity. Before the *henananoo* were several pieces of wood, carved in some resemblance of human figures. There was also a stone near two feet in height, covered with cloth. Adjoining to this, on the outside of the morai, was a small shed, which they call *hareepahoo*; and before it was a grave, where the remains of a woman had been deposited. On the further side of the area of the morai was a house, or shed, called *hemanaa*, about forty feet in length, ten in breadth, but narrower at each end: though considerably longer, it was lower than their common habitations. Opposite the entrance into this house stood two images, near three feet high, cut out of one piece of wood, with pedestals: they were said to be *Eatoa no Veheina*, or representations of goddesses, and were not very indifferent either in design or execution. On the head of one of them was a cylindrical cap, not unlike the head-dress at Otaheite, called *tomou*; and on that of the other, a carved helmet, somewhat resembling those of the ancient warriors, and both of them had pieces of cloth fastened about the loins, and hanging down a considerable

London Published by Geo. Meeg at the Kings Arms, No 21, Newgate Street.

siderable way. At the side of each was also a piece of carved wood, with cloth hung on it. Before the pedestals lay a quantity of fern, that had been placed there at different times. In the middle of the house, and before the images, was an oblong space, inclosed by an edging of stone, and covered with shreds of cloth: this was the grave of seven chiefs, and was called *heneene*. We had already met with so many instances of resemblance, between the morai we were now visiting, and those of the islands we had lately visited, that we entertained little doubt in our own minds of the similarity in their rites, and particularly in the horrid obligation of human sacrifices. Our suspicions were soon confirmed; for on one side of the entrance into the *hemanaa* we observed a small square place, and another still smaller; and on asking what these were, we were informed by our conductor, that in one of them was interred a man, and in the other a hog, both which had been offered up to the deity. At no great distance from these were three other square inclosed places, with two pieces of carved wood at each of them, and a heap of fern upon them. These were the graves of three chiefs, and before them was an inclosed space, of an oblong figure, called *Tangatataboo*, by our guide, who declared to us, that three human sacrifices, one at the funeral of each chief, had been buried there. Indeed, every appearance induced us to believe, that this inhuman practice was very general. In many spots within this burying-ground, were planted trees of the *Morinda Citrifolia*, and *Cordia Sebaftina*, besides several plants of the *Etee*, with the leaves of which the *hemanaa* was thatched.

Our journey to and from this morai, lay through the plantations. We observed most of the ground was perfectly flat, with ditches intersecting different parts, and roads that seemed to have been raised to some height by art. The intervening spaces, in general, were planted with taro, which grew with great vigour. There were several spots where the cloth-mulberry was planted, in regular rows; this also grew vigorously. The cocoa-trees were in a less thriving condition, and were all low; but the plantain-trees made a pretty good appearance. Upon the whole, the trees that are most numerous around this village, are the *cordia sebaftina*. The greatest part of the village is near the beach, and consists of upwards of sixty houses there, and we saw near forty more scattered about towards the morai. After we had carefully examined whatever was worthy of notice about the morai, we returned by a different rout. We found a multitude collected at the beach, and a brisk trade for fowls, pigs, and vegetables, going on, with the greatest order and decorum: at noon Captain Cook went on board to dinner, and then sent Mr. King to take the command of the party on shore. During the afternoon he landed again, accompanied by Captain Clerke, intending to make another excursion up the country; but before he could execute this design the day was too far spent; he therefore relinquished his intention for the present, and no opportunity afterwards occurred.

Towards sun-set, the Captain and our people returned on board, after having procured, in the course of this day, nine tons of water, and (principally by exchanging nails, and pieces of iron) seventy pigs, some fowls, plantains, potatoes, and taro roots. In this commercial intercourse, the islanders deserved our best commendations, making no attempts to cheat us, either along side our ships, or on shore. Some of them, indeed, as we have already related, betrayed at first a pilfering disposition, or, perhaps, they imagined that they had a right to all they could lay their hands on; but they quickly desisted from a conduct, which, we convinced them, could not be persevered in with impunity. Among the various articles which they brought to barter this day, we were particularly pleased with a sort of cloak and cap, which, even in more polished countries, might be esteemed elegant. These cloaks are nearly of the shape and size of the short ones worn by the men in Spain, and by the women in England, tied loosely before, and reaching to the middle of the

back. The ground of them is a net work, with the most beautiful red and yellow feathers so closely fixed up it, that the surface, both in point of smoothness and glossiness, resembles the richest velvet. The methods of varying the mixture are very different, some of them having triangular spaces of yellow and red alternately; others a sort of crescent; while some were entirely red, except that they had a broad yellow border. The brilliant colour of the feathers, in those cloaks that were new, had a very fine effect. The natives, at first, refused to part with one of these cloaks for any thing we offered in exchange, demanding no less price than one of our muskets. They afterwards, however, parted with some of them for very large nails. Those of the best sort were scarce; and it is probable, that they are used only on particular occasions. The caps are made in the form of a helmet, with the middle part or crest, frequently of a hand's breadth. They fit very close upon the head, and have notches to admit the ears. They consist of twigs and osiers, covered with net-work, into which feathers are wrought, as upon the cloaks, but somewhat closer, and less diversified; the major part being red, with some yellow, green, or black stripes, on the sides. These caps, in all probability, complete the dress, with the cloaks; for the islanders appeared sometimes in both together. We could not conjecture from whence they obtained such a quantity of these beautiful feathers; but we soon procured intelligence respecting one sort; for they afterwards brought for sale great numbers of skins of a small red species of birds, frequently tied up in bunches of twenty or upwards, or having a wooden skewer run through them. At first, those that were purchased consisted only of the skin from behind the wings forward; but we afterwards obtained many with the hind part, including the feet and tail. The former instantly suggested to us the origin of the fable of the birds of paradise being destitute of legs, and sufficiently explained that particular. The reason assigned by the inhabitants of Atooi for the custom of cutting off the feet of these birds, is, that by this practice they can preserve them the more easily, without losing any part which they consider as more valuable. According to Mr. Anderson, the red bird of this island is a species of *merops*, about as large as a sparrow; its colour a beautiful scarlet, with the tails and wings black; a bill arched, and twice as long as the head, which, with the feet, is of a reddish hue. The contents of the heads were taken out, as in the birds of paradise; but we did not find that they practiced any other mode of preserving them, than that of simple drying.

On Thursday the 22d we had almost continual rain for the whole morning. The wind was at S. E. S. S. E. and S. and the surf broke so high upon the shore, that our boats were prevented from landing. We were not in a very secure situation, there being breakers within the length of little more than two cables from the Resolution's stern. The natives, notwithstanding the surf, ventured out in their canoes, bringing off to us hogs and vegetables, which they exchanged, as before, for our commodities. One of their number, who offered some fish-hooks for sale, was observed to have a very small parcel, fastened to the string of one of them, which he carefully separated, and reserved for himself, when he had disposed of the hook. Upon being asked what it was, he pointed to his belly; saying, at the same time, it was bad. He was requested to open the parcel, which he did with great reluctance, and we found that it contained a small thin piece of flesh, which had, to all appearance, been dried, but was at present wet with salt water. Imagining that it might be human flesh, we put the question to the producer of it, who answered, that the flesh was part of a man. Another of the islanders who stood near him was then asked, whether it was a custom among them to eat their enemies who had been slain in battle; and he immediately replied in the affirmative. In the afternoon we had some intervals of fair weather. The wind then changed to the E. and N. E. but, towards the evening, it veered back again to S. S. E. The rain also returning, continued the whole night, but was not attended with much wind. On the 23d, at seven

seven o'clock A. M. a north-easterly breeze springing up, our anchors were ordered to be taken up, with a view of removing the Resolution further out. As soon as the last anchor was up, the wind veering to the east, rendered it necessary to make all the sail we could, for the purpose of clearing the shore; so that before we had good sea-room, we were driven considerably to leeward. We endeavoured to regain the road, but having a strong current against us, and very little wind, we could not accomplish that design. Our Commodore therefore dispatched Messrs. King and Williamson ashore, with three boats, to procure water and refreshments, sending at the same time, an order to Captain Clerk, to put to sea after him, if he should find that the Resolution was unable to recover the road. Having hopes of finding perhaps a harbour, at the west end of the island, we were the less anxious of regaining our former station; but boats having been sent thither, we kept as much as possible to windward, notwithstanding which, at noon, our ship was three leagues to leeward. As we approached the west end, we found that the coast rounded gradually, to the N. E. without forming a cove, or creek, wherein a vessel might be sheltered from the violence of the swell, which rolling in from the northward, broke against the shore in an amazing surf: all hopes, therefore, of meeting with a harbour here soon vanished. Many of the natives, in their canoes, followed us as we stood out to sea, bartering various articles. As we were extremely unwilling, notwithstanding the suspicious circumstances of the preceding day, to believe that these people were cannibals, we now made some further enquiries on this subject. A small instrument of wood, beset with shark's teeth, had been purchased, which, as it resembled the saw or knife made use of by the savages of New Zealand to dissect the bodies of their enemies, was suspected by us to be employed here for the same purpose. One of the islanders being questioned on this point, informed us, that the instrument above mentioned served the purpose of cutting out the fleshy part of the belly, when any person was slain. This explained and confirmed the circumstance before related, of the man's pointing to his belly. The native, however, from whom we now received this intelligence, being asked whether his countrymen eat the part thus cut out, strongly denied it; but when the question was repeated, he shewed some degree of apprehension, and swam off to his canoe. An elderly man, who sat foremost in the canoe, was then asked, whether they eat the flesh, and he answered in the affirmative. The question being put to him a second time, he again affirmed the fact; adding that it was savoury food. In the evening, about seven o'clock, the boats returned with a few hogs, some roots, plantains, and two tons of water. Mr. King reported to our Commodore, that the islanders were very numerous at the watering place, and had brought great numbers of hogs to barter; but our people had not commodities with them sufficient to purchase them all. He also mentioned, that the surf had run so very high, that it was with extreme difficulty our men landed, and afterwards got back into the boats.

On Saturday, the 24th, at day-break, we found that our ship had been carried by the currents to the N. W. and N. so that the western extremity of Atooi, bore E. at the distance of one league. A northerly breeze sprung up soon after, and, expecting that this would bring the Discovery to sea, we steered for Onecheow, a neighbouring island, which then bore S. W. with a view of anchoring there. We continued to steer for it till past eleven, when we were distant from it about six miles: but not seeing the Discovery, we were apprehensive lest some ill consequence might arise from our separating so far; we therefore relinquished the design of visiting Onecheow for the present, and stood back to Atooi, intending to cast anchor again in the road, in order to complete our supply of water. At two o'clock, the northerly wind was succeeded by calms and variable light airs, which continued till eleven at night. We stretched to the S. E. till early in the morning of the 25th, when we tacked and stood in for Atooi road; and, not long after, we were joined by the Discovery.

We remained several days beating up, but in vain, to regain our former birth; and by the morning of Thursday, the 29th, the currents had carried us to the westward, within nine miles of Onecheow. Weary with plying so unsuccessfully, we laid aside all thoughts of returning to Atooi, and resumed our intention of paying a visit to Onecheow. With this view the master was dispatched in a boat to found along the coast, and search for a landing place, and afterwards fresh water. In the mean time the ships followed under an easy sail. The master, at his return, reported, that there was tolerable anchorage all along the coast; and that he had landed in one place, but could not find any fresh water: but being informed by some of the natives, who had come off to the ships, that fresh water might be obtained at a village in sight, we ran down and cast anchor before it, about six furlongs from the shore, the depth of water being 26 fathoms. The Discovery anchored at a greater distance from the shore, in 23 fathoms. The fourth-eastern point of Onecheow bore south, 65 deg. E. about one league distant; and another island which we had discovered the preceding night, named Tahoor, bore S. 61 deg. W. distant 7 leagues.

Before we anchored, several canoes had come off to us, bringing potatoes, yams, small pigs, and mats. The people resembled in their persons the inhabitants of Atooi, and, like them, were acquainted with the use of iron, which they asked for by the names of *toe* and *hamaite*, readily parting with all their commodities for pieces of that metal. Some more canoes soon reached our ships, after they had come to anchor; but the islanders who were in these had apparently no other object, than to make us a formal visit. Many of them came on board, and crouched down on the deck; nor did they quit that humble posture, till they were requested to rise. Several women, whom they had brought with them, remained along-side the canoes, behaving with much less modesty than the females of Atooi; and, at intervals, they all joined in a song, which, though not very melodious, was performed in the exactest concert, by beating time upon their breasts with their hands. The men who had come on board did not continue long with us; and before their departure, some of them desired permission to lay down locks of hair on the deck. This day we renewed the enquiry whether these islanders were cannibals, and the subject did not arise from any questions put by us, but from a circumstance that seemed to remove all doubt. One of the natives, who wished to get in at the gun-room port, was refused, and he then asked, whether we should kill and eat him, if he should come in? accompanying this question with signs so expressive, that we did not entertain a doubt with respect to his meaning. We had now an opportunity of retorting the question, as to this practice; and a man behind the other, in the canoe, instantly replied, that, if we were killed on shore, they would not scruple to eat us; not that he meant they would destroy us for that purpose, but that their devouring us would be the consequence of our being at enmity with them. In the afternoon, Mr. Gore was sent with three armed boats, in search of the most commodious landing-place; being also directed to look for fresh water when he should get ashore. He returned in the evening, and reported, that he had landed at the village, and had been conducted to a well about half a mile up the country; but that the water it contained was in too small a quantity for our purpose, and the road that led to it was extremely bad.

On Friday, the 30th, Mr. Gore was sent ashore again, with a guard, and a party to trade with the inhabitants for refreshments. The Captain's intention was to have followed soon afterwards; and he went from the ship with that design: but the surf had so greatly increased by this time, that he was apprehensive, if he got ashore, he should not be able to make his way back again. This circumstance really happened to our people who had landed with Mr. Gore; for the communication between them and the ships, by our own boats, was quickly stopped. They made a signal, in the evening, for the boats, which were accordingly sent; and in a short

short time afterwards returned with some good salt, and a few yams. A considerable quantity of both these articles had been obtained in the course of the day; but the surf was so exceedingly high, that the greatest part of both had been lost in bringing them off to the boats. The officer and twenty men, not venturing to run the risque of coming off, remained all night on shore, by which unfortunate circumstance, the very thing happened which Captain Cook, as we have already related, so eagerly wished to prevent, and imagined he had guarded effectually against. However, the violence of the surf did not deter the natives from coming off in canoes to our ships. They brought with them some refreshments, for which we gave them in exchange, some nails, and pieces of iron hoops; and we distributed among the women in the canoes, buttons, bracelets, and many pieces of ribbons. Some of the men had representations of human figures punctured upon their breasts, and one of them had a lizard represented. These visitants told us no chief was over this island, but that it was subject to one of the chiefs of Atooi, whose name was Teneconeoo. Among other articles which they now brought off to us, was a small drum, that had a great resemblance to those of Otaheite. Between ten and eleven o'clock at night, the wind became southerly, and the sky seemed to indicate an approaching storm. In consequence of these threatening appearances orders were given for the anchors to be taken up; and the ships being carried into 40 fathoms water, came to again in that more secure station: yet this proved an unnecessary precaution; for the wind, not long after, veering to the N. N. E. blew a fresh gale, with squalls, and violent showers of rain. This weather continued for the whole succeeding day, during which the sea ran so high, that all communication with our party on shore was totally intercepted, and the islanders themselves would not venture out to the ships in their canoes. Towards the evening, the Commodore sent the master in a boat to the S. E. point of the island, to try whether he could land in that quarter. He returned with a favourable report; but it was now too late to send for our party, so that they were obliged to stay another night on shore.

On Sunday, the 1st of February, on the appearance of day-light, a boat was dispatched to the S. E. point, with orders to Lieutenant Gore, that, if he could not embark his people from the spot where they at present were, he should march them up to the point. The boat being prevented from getting to the beach, one of the crew swam to the shore, and communicated the instructions. On the return of our boat, Captain Cook went himself with the launch and pinnace up to the point, in order to bring off our party from the land. We took with us three goats, one male, the others female; a young boar and sow of the English breed; and also the seeds of onions, pumpkins, and melons. With great ease, we landed under the west side of the point, where we found our party, in company with some of the natives. To one of these, who assumed some degree of authority over the rest, the Captain gave the goats, pigs, and seeds. He intended to have left these useful presents at Atooi, had we not been unexpectedly driven from that island. While our people were employed in filling some water-casks, from a little stream which the late rains had occasioned, Captain Cook made a short excursion into the country, accompanied by the islander above-mentioned, and followed by two others, who carried the pigs. When arrived upon a rising ground, the Captain stopped to look around him, and immediately observed a woman, on the opposite side of the valley in which he had landed, calling out to her countrymen who attended him. Upon this the man who acted as chief began to mutter something, as if he was praying; and the two bearers of the pigs continued walking round him all the time, making about a dozen circuits before the other had made an end of his oraison. This strange ceremony being performed, they proceeded on their walk, and met people coming from all parts, who upon being called to by the Captain's attendants, fell prostrate

No. 65.

on their faces till he was out of sight. The ground over which he passed, though it was uncultivated and very stoney, was covered with plants and shrubs, some of which perfumed the air with the most delicious fragrance.

Our party who had been detained so long on shore, found in those parts of the island they had traversed, several salt ponds, some of which had a small quantity of water remaining, but others had none. They saw no appearance of a running stream; and though in some small wells the fresh water was pretty good, it seemed to be scarce. The houses of the natives were thinly inhabited, and scattered about; and it was supposed, that there were not more than 500 persons in the whole island. The method of living among these people was decent and cleanly. No instance was observed of the men and women eating together; and the latter seemed in general to be associated in companies by themselves. The only nuts of the dooc dooc are burned by these islanders for lights during the night; and they dress their hogs by baking them in ovens, splitting them through the whole length of the carcass. Our people met with a sufficient proof of the existence of the taboo among them; for one woman was employed in feeding another, she being under that interdiction. Several other mysterious ceremonies were also observed; one of which was performed by a woman, who threw a pig into the surf, which was drowned; she then tied up a bundle of wood, and disposed of it in the same manner. At another time, the same female beat a man's shoulders with a stick, after he had seated himself for that purpose. An extraordinary veneration seemed to be paid here to owls, which they keep very tame. It is a pretty general practice among them, to pull out one of their teeth; and when they were asked the reason of this remarkable custom, the only answer they gave was, it is techa; which was also the reason assigned by them for giving a lock of hair. After our water casks had been filled, and some roots, salt, and salted fish, had been purchased from the natives, we returned on board with all our people, intending to make another visit to the island the next day: but, about seven in the evening, the anchor of our ship started, and she drove off the bank. By this accident, we found ourselves, at day-break the next morning, being the 2nd, nine miles to the leeward of our last station; and the Captain foreseeing that it would require more time to regain it than he chose to employ, made the signal for the Discovery to weigh anchor and join us. At noon both ships took their departure, and steered to the northward, in prosecution of their voyage. But before we proceed to the northern hemisphere, in order to make new discoveries, we shall present the friends and subscribers to this history of voyages, with the observations, made by several of our gentlemen, on this whole cluster of isles, which Captain Cook distinguished by the name of Sandwich Islands, in honour of the Earl of Sandwich. Those which we saw are situated between the latitude of 21 deg. 30 min. and 22 deg. 15 min. N. and between the longitude of 199 deg. 20 min. and 201 deg. 30 min. E.

They are not inferior in beauty and fertility to the Friendly Islands in the southern hemisphere, nor are the inhabitants less ingenious or civilized. It is worthy of observation, that the islands in the Pacific Ocean, which have been discovered in the course of our late voyages, have been generally found situate in groups; the single intermediate isles, hitherto met with, being few in proportion to the rest; though, in all probability, there are many more of them yet unknown, which serve as gradations or steps between the several clusters. Of what number this new-discovered archipelago is composed, must be left to the decision of future navigators. We observed five of them, whose names are Woahoo, Atooi, Onecheow, Oreehoua, and Tahoorā. This last is a small elevated island, at the distance of four or five leagues from the S. E. point of Onecheow. We were told, that it abounds with birds, its sole inhabitants. We also gained intelligence of the existence of a low uninhabited island in the neighbourhood, named Tammata-pappa. Besides these six, we were told that

there were some other islands both to the eastward and westward. There seems to be a remarkable conformity (observes one of our gentlemen) between these islands and those of the opposite hemisphere, not only in their situation, but in their number, and in their manners, customs, arts, and manufactures of the inhabitants; yet, it can scarcely be imagined, that they could ever have any communication, as the globe is now constituted, being more than 2000 miles distant one from the other: but from this general conformity among the tropical islanders, some have been led to believe, that the whole middle region of the earth, was once one entire continent, and that what is now the Great South Pacific Ocean was, in the beginning, the Paradise of the World.

With respect to Woahoo, the most easterly of these islands, seen by us, we could get no other information, than that it is high land, and inhabited. But as to Oneeheow, concerning which some particulars have been already mentioned, this lies seven leagues to the westward of our anchoring-place at Atooi, and does not exceed 15 leagues, or 45 miles, in circumference. Yams are its principal vegetable production. We procured some salt here, called by the natives patai, which is produced in salt ponds. With it they cure both fish and pork; and some salt fish, which we purchased from them were kept very well, and extremely good. This island is chiefly low land, except the part opposite Atooi, which rises immediately from the sea to a considerable height; as does also its S. E. point, which terminates in a round hill. We know no other particulars concerning Oneeheow: and of Oreehoua we can only say, that it is a small elevated island, lying close to the north side of Oneeheow.

Atooi was the principal scene of our operations, and the largest island we saw. From our observations, we think it to be at least 30 miles in length from E. to W. from whence its circumference may nearly be determined, though it appears to be much broader at the E. than at the W. point. The road, or anchoring place, which our vessels occupied, is on the S. W. side of the island, about two leagues from the west end, before a village, named Wymoa. As far as we founded, we found the banks free from rocks; except to the eastward of the village, where there projects a shoal, on which are some rocks and breakers. This road is somewhat exposed to the trade wind; notwithstanding which, it is far from being a bad station, and greatly superior to those which necessity continually obliges ships to use, in countries where the winds are not more variable, but more boisterous; as at Madeira, Teneriffe, the Azores, &c. The landing too is not so difficult as at most of those places; and, unless in foul weather, is always practicable. The water in the neighbourhood is excellent, and may be conveyed with ease to the boats. But no wood can be cut at any convenient distance, unless the islanders could be prevailed upon to part with the etooa trees, (for that is the name they give to the cordia sebastina) that grow about their villages, or a species called dooe dooe, which grows farther up the country. The land does not in the least resemble, in its general appearance, any of the islands we have visited within the tropic of Capricorn; if we except its hills near the centre, which are high, but slope gradually towards the sea, or lower lands. Though it presents not to the view the delightful borders of Otahete, or the luxuriant plains of Tongataboo, covered with trees, which at once afford a shelter from the scorching rays of the sun, a beautiful prospect to the eye, and food for the natives; yet its possessing a greater portion of gently rising land, renders it, in some degree, superior to the above-mentioned favourite islands, as being more capable of improvement. The height of the land within, and the clouds which we saw, during the whole time of our continuance, hanging over it, and not unfrequently on the other parts, seem to indicate that there is a sufficient supply of water, and that there are some running streams which we had an opportunity of seeing, particularly in the deep vallies, at the entrance of which the villages are, in general, situated. The ground, from the woody part to the sea, is covered with an excellent

kind of grass, about two feet in height, which sometimes grows in tufts, and appeared capable of being converted into abundant crops of fine hay. But on this extensive space not even a shrub grows naturally. In the narrow valley leading to the Morai, the soil is of a dark brown colour, rather loose; but on the high ground, it is of a reddish brown, more stiff and clayey. It is probably the same all over the cultivated parts; for what adhered to most of the potatoes that we purchased, which, doubtless, came from very different spots, was of this sort. Its quality, however, may be better estimated from its productions, than from its appearance: for the vale, or moist ground, produces taro, much larger than any we had ever seen; and the more elevated ground furnishes sweet potatoes, that seldom weigh less than two or three pounds, and frequently weigh ten, and sometimes fourteen pounds.

Were we to judge of the climate from our experience, it might be said to be very variable; for according to the general opinion, it was, at this time, the season of the year when the weather is supposed to be most settled, the sun being at his greatest annual distance. The heat was now very moderate; and few of those inconveniences to which many of the countries lying within the tropics are subject, either from heat, or moisture, seem to be experienced here. Nor did we find any dews of consequence: a circumstance which may partly be accounted for, by the lower part of the country being destitute of trees. The rock that constitutes the sides of the valley, is a dark grey ponderous stone; but honey-combed, with some spots of a rusty colour, and some very minute shining particles interspersed. It is of an immense depth, and seems to be divided into strata, though nothing is interposed; for the large pieces always broke off to a determinate thickness, and did not appear to have adhered to those that were below them. Other stones are, in all probability, much more various than in the southern islands. For during the short time we remained here, besides the lapis lydius, we found a species of cream-coloured whetstone, sometimes variegated with whiter or blacker veins like marble; and common writing-slate, as well as some of a coarser sort; and the natives brought us some pieces of a coarse whitish pumice stone. We also procured a brown sort of hæmatites, which from its being strongly attracted by the magnet, discovered the quantity of metal it contained. What we saw of this was cut artificially, as were also the slates and whetstones.

Of vegetables, birds, fish, and tame animals, we saw various kinds. Besides the vegetables purchased by us as refreshments, among which were, at least, five or six varieties of plantains, the island produces bread-fruit, and the sugar-cane: the former seems to be scarce, as we only saw one tree of that species; but the latter appears to be indigenous to these islands, and rare in those on the other side of the line. There are also here a few cocoa-palms; some yams; the kappe of the Friendly Isles, or Virginian arum; or Cape Jasmine. We saw several trees of the dooe dooe, that bear the oily nuts, which are stuck upon a kind of skewer, and made use of as candles. They are used in the same manner at Oneeheow. We were not ashore at Atooi except in the day-time, and then we observed the islanders wearing these nuts, hung on strings, round their necks. There is a species of sida, or Indian mallow; also the morinda citrifolia, which is here called none; a species of convolvulus; the ava, or intoxicating pepper, besides great quantities of gourds. These last grow to a very large size, and are remarkable for their variety of shapes, the effect, perhaps, of art. Upon the dry sand, about the village grows a plant, that had never been seen by us in this ocean, of the size of a common thistle, and prickly; but bearing a fine flower, greatly resembling a white poppy. The scarlet birds, brought for sale, were never met with alive; but we saw a small one, about the size of a canary bird, of a deep crimson colour. We also saw a large owl, two brown hawks, or kites, and a wild duck. We heard from the natives the names of some other birds; among which were the

London: Published by Messrs. W. & A. G. Smith, 15, Pall Mall.

ootoo, or blueish heron, and the torata, a sort of whimbrel. It is probable that the species of birds are numerous, if we may judge by the quantity of fine yellow, green, and small velvet-like blackish feathers, used upon the cloaks, and other ornaments worn by these people. Fish, and other productions of the sea, were, to appearance, not various; as, besides the small mackarel, we only saw common mullets; a species of a chalky colour; a small brownish rock-fish, adorned with blue spots; a turtle, which was penned up in a pond; and three or four sorts of fish salted. The few shell-fish seen by us were chiefly converted into ornaments, though they were destitute of the recommendation either of beauty or novelty. The only tame or domestic animals that we found here were hogs, dogs, and fowls, which were all of the same kind that we met with at the islands of the South Pacific. There are also small lizards; and some rats, resembling those of every island we had hitherto visited.

The inhabitants of Atooi are of the middle size, and not much tawowed. In general they are stoutly made, with a lively open countenance; but they are remarkable for having neither a beautiful shape, nor striking features. Their visage, particularly that of the women, is sometimes round; but in others long; nor can it justly be said, that they are distinguished, as a nation, by any peculiar cast of countenance. Their complexion is nearly of a nut brown; but some individuals are of a darker hue. We have already mentioned the women as being little more delicate than the men in their formation; and we may add, that, with few exceptions, they have little claim to those peculiarities that distinguish the sex in most other parts of the world. There is, indeed, a very remarkable equality in the size, colour, and figure, of the natives of both sexes: upon the whole, however, they are far from being ugly, and have, to all appearance, few natural deformities of any kind. Their skin is not very soft, nor shining; but their eyes and teeth are, for the most part, pretty good. Their hair, in general, is straight; and though its natural colour is usually black, they stain it, as at the Friendly and other islands. We perceived but few instances of corpulence, and these more frequently among the women than the men; but it was principally among the latter that personal defects were observed; though if any of them can lay claim to a share of beauty, it appeared to be most conspicuous among the young men. They are active, vigorous, and most expert swimmers; leaving their canoes upon the most frivolous occasion; diving under them; and swimming to others, though at a considerable distance. We have frequently seen women with infants at the breast, when the surf was so high as to prevent their landing with canoes, leap overboard, and swim to the shore, without endangering their little ones. They appear to be of a frank, cheerful disposition; and are equally free from the fickle levity which characterizes the inhabitants of Otaheite, and the sedate cast, observable among many of those of Tongataboo. They seem to cultivate a sociable intercourse with each other; and, except the propensity to thieving, which is, as it were, innate in most of the people we have visited in these seas, they were extremely friendly to us. And it does not small credit to their sensibility, without flattering ourselves, that when they saw the different articles of our European manufactures, they could not refrain from expressing their astonishment, by a mixture of joy and concern, that seemed to apply the case as a lesson of humility to themselves; and on every occasion, they appeared to have a proper consciousness of their own inferiority; a behaviour that equally exempts their national character from the ridiculous pride of the more polished Japanese, and of the ruder native of Greenland. It was pleasing to observe with what affection the women managed their infants, and with what alacrity the men contributed their assistance in such a tender office; thus distinguishing themselves from those savages who consider a wife and child as things rather necessary than desirable, or worthy of their regard or esteem. From the numbers that we saw assembled at every village, as we coasted along, it

may be conjectured, that the inhabitants of this island are pretty numerous. Including the straggling houses, there may perhaps be, in the whole island, sixty such villages, as that near which our ships anchored; and, if we allow five persons to each house, there will be, in every village 500, or 30,000 upon the island. This number is by no means exaggerated, for there were sometimes 3000 people, at least, collected upon the beach; when it could not be supposed that above a tenth part of the whole were present.

The ordinary dress of both sexes has been already described. The women have often much larger pieces of cloth wrapped about them, extending from just below the breasts to the hams, and sometimes lower; and several were observed with pieces thrown loosely over their shoulders, which covered the greatest part of their body; but the children, when very young, are entirely naked. They wear nothing upon the head; but the hair, both of men and women, is cut in various forms; and the general fashion, particularly among the latter, is to have it short behind, and long before. The men frequently had it cut on each side in such a manner, that the remaining part somewhat resembled the crest of their caps, or that, which, in horses manes, is called hogging. Both sexes, however, seemed to be very careless about their hair, and had no combs, nor any thing of the kind, to dress it with. The men sometimes twist it into a number of separate parcels, like the tails of a wig, each about as thick as a finger; though most of those which are so long as to reach far down the back, are artificially fixed upon the head, over their own hair. Contrary to the general practice of most of the islands in the Pacific Ocean, the inhabitants of the Sandwich Isles have not their ears perforated, nor do they wear any ornaments in them. Both men and women, however, adorn themselves with necklaces composed of bunches of small black cord, like our hat strings, often above a hundred fold; entirely resembling those we saw worn at Watecoo, except that, instead of the two little balls on the middle before, they fix a small piece of wood, stone, or shell, about two inches in length, with a broad hook, well polished. They have also necklaces of many strings of very small shells, or of the dried flowers of the Indian mallow; and they sometimes hang round their necks a small human figure of bone, about the length of three inches. The women likewise wear bracelets of a single shell, pieces of black wood, with bits of ivory interspersed, and neatly polished, fastened together by a string drawn closely through them; or others of hogs teeth, placed parallel to each other, with the concave part outward, and the points cut off; some of which, formed only of large boar's tusks, are very elegant. The men sometimes fix on their heads plumes of feathers of the tropic bird; or those of cocks; fastened round neat polished sticks, two feet in length; and, for the same purpose, they sew the skin of a white dog's tail over a stick, with its tuft at the end. They also, not unfrequently, wear on the head a kind of ornament, of the thickness of a finger, or more, covered with yellow and red feathers, curiously varied, and tied behind; and, on that part of the arm which is above the elbow, a sort of broad shell work, grounded upon net-work. The men sometimes puncture themselves upon their hands or arms, and near the groin; but frequently we saw no marks at all; though a few individuals had more of this species of ornament than we had usually seen at other places, and curiously executed in a great variety of lines and figures, on the arms and fore-part of the body.

Near any of their villages, there is no appearance of defence, or fortifications; and the houses are scattered about, without the least order. Some of these habitations are large and commodious, from forty to fifty feet in length, and twenty or thirty in breadth; while others of them are contemptible hovels. Their figure resembles that of hay-stacks, or perhaps a better idea may be conceived of them, by supposing the roof of a barn placed on the ground, in such a manner as to form a high acute ridge, with two low sides. The gable at each

each end, corresponding to the sides, makes these abodes close all round, and they are well thatched with long grass, which is laid on slender poles. The entrance is made either in the end or side, and is an oblong hole, extremely low; often shut up by a board of planks, fastened together, which serves as a door; but as it has no hinges, must be removed occasionally. No light enters the house except by this opening; and though such close habitations may be comfortable places of retreat in bad weather, they seem but ill adapted to the warm climate of this country. They are kept remarkable clean, and the floors are strewn with dried grass, over which mats are spread to sit and sleep on. At one end stands a bench, about three feet high, on which the domestic utensils are placed. These consist of gourd shells, which the natives convert into vessels that serve as bottles to hold water, and as baskets to contain various articles; also a few wooden bowls, and trenchers of various sizes. From what we saw growing, and from what was brought to market, we have no doubt, that sweet potatoes, taro, and plantains, constitute the principal part of their vegetable diet; and that yams and bread-fruit are rather to be considered as rarities. Of animal food, they appear to be in no want, having great numbers of hogs, which run, without restraint, about the houses; and, if they eat dogs, which is not improbable, their stock of these seemed very considerable. The quantities of fishing hooks found among them, indicates that they procure a tolerable supply of animal food from the sea. They have a custom of salted fish, and likewise pork, which they preserve in gourd-shells. The salt used for this purpose is of a reddish colour, but not very coarse, and seems to be nearly the same with what our stragglers found at Christmas island. Its colour is doubtless derived from a mixture of mud, at the bottom of the place where it is found; for some of it, which had adhered in lumps, was of a tolerable whiteness. They bake their vegetable articles of food with heated stones; and, from the great quantity which we saw dressed at one time, we imagined, that all the inhabitants of a village, or at least a considerable number of people, joined in the use of a common oven. We did not perceive them dress any animal food at this island. The only artificial dish we saw them dress was a taro pudding, which, though very four, was devoured with avidity by the natives. They eat off a sort of wooden trenchers; and, as far as we were enabled to judge from one instance, the women, if restrained from feeding on the same dish with the men, as is the custom at Otaheite, are at least allowed to eat in the same place near them.

The amusements of these people are various. We did not see the dances at which they use the feathered cloaks and caps; but, from the motions they made with their hands, on other occasions, when they sung, we judged that they were similar to those we met with at the southern islands, though not so skilfully performed. They had not among them either flutes or reeds, and the only two musical instruments, seen by us, were of an exceeding rude kind. One of them does not produce a melody superior to that of a child's rattle. It consists of what may be denominated a conic cap inverted, but very little hollowed at the base, made of a sedge-like plant; the upper part of which, and likewise the edges, are embellished with beautiful red feathers; and to the point, or lower part, is fixed a gourd-shell. Into this they put something to rattle, which is done by holding the instrument by the small part, and shaking it briskly before the face, at the same time striking the breast with the other hand. The other instrument was a hollow vessel of wood, not unlike a platter, accompanied with two sticks, whereon one of our gentlemen saw a man performing. He held one of the sticks, about two feet in length, with one hand, in the same manner as we hold a violin, and struck it with the other, which was smaller, and resembled a drum-stick, in a quicker or slower measure, beating with his foot, at the same time, upon the hollow vessel, that lay upon the ground inverted, and thus producing a tune, that was not disagreeable. This music was accompanied by the vocal performance

of some women, whose song had a pleasing effect. They have great numbers of small polished rods, of the length of between four and five feet, rather thicker than the rammer of a musquet, with a tuft of long dogs hair fixed on the small end. These they probably make use of in their diversions. We saw a native take one of them in his hand, and holding it up, give a smart stroke, till it was brought into an horizontal position, striking the ground with his foot, on the same side, and beating his breast with his other hand. They play at bowls with pieces of the whet-stone, shaped somewhat like a cheele, but rounded at the edges and sides, which are very neatly polished. They have other bowls made of a reddish-brown clay, glazed over with a composition of the same colour, or of a dark-grey coarse slate. They also use as quoits, small, flat, roundish pieces of writing slate, scarcely a quarter of an inch thick.

As to the manufactures of these people, they discover an extraordinary degree of ingenuity and neatness. Their cloth is made from the *morus papyrifera*, and, doubtless, in the same manner, as at Tongataboo and Otaheite; for we bought some of the grooved sticks with which they beat it. Its texture, however, though thicker, is inferior to that of the cloth of either of the places just mentioned; but, in colouring or staining it, the inhabitants of Atouai display a superiority of taste, by the infinite variety of figures which they execute. Their colours, indeed, are not very bright, except the red; but the regularity of the figures and stripes is amazing, for, as far as we know, they have nothing like stamps or prints, to make the impressions. We had no opportunity of learning in what manner they produce their colours; but, besides the variety of variegated sorts, they have some pieces of plain white cloth, and others of a single colour, particularly light blue, and dark brown. In general, the pieces brought to us were about the breadth of two feet, and four or five yards in length, being the form and quantity made use of by them for the common dress, or *maro*; and even some of these were composed of pieces sewed together. They have also a particular sort that is thin, and greatly resembles oil-cloth, and which is either oiled, or soaked in some kind of varnish. They fabricate numbers of white mats, which are strong, with many red stripes, rhombuses, and other figures interwoven on one side. These, in all probability, make, occasionally, a part of their dress, for when they offered them to sale they put them on their backs. They manufacture others of a coarser sort, plain and strong, which they spread over their floors to sleep upon. They stain their gourd-shells neatly with undulated lines, triangles, and other figures of a black colour. They also seem to be acquainted with the art of varnishing, for some of their stained gourd-shells are covered with a sort of lacker; and, on other occasions, they make use of a strong size, or glutinous substance, to fasten things together. Their wooden dishes and bowls, out of which they drink their *ava*, are of the *Etoa* tree, extremely neat and well polished. They likewise make small square fans of mat or wicker-work, with handles of the same, or of wood, tapering from them, which are curiously wrought with small cords of hair, and cocoa-nut fibres, intermixed. Their fishing hooks are ingeniously made, some of bone, many of pearl-shell, and others of wood, pointed with bone. The bones are for the most part small, and consist of two pieces, and the various sorts have a barbe, either on the inside, like ours, or on the outside; but others have both, the exterior being farthest from the point. Of the latter sort one was procured, nine inches in length, made of a single piece of bone, the elegant form and polish of which could not be exceeded by any European artist. They polish their stones by constant friction, with pumice stone in water; and such of their tools as we saw, resembled those of the southern islanders. Their hatchets, or rather adzes, were exactly of the same pattern, formed either of a blackish stone, or of a clay-coloured one. They have also small instruments composed of a single shark's tooth, some of which are fixed to the fore-part of the jaw-bone of a dog, and others to a thin wooden handle of a similar shape;

London. Pall Mall. The Village of the Kings. The Kings of the River.

shape; and at the other end there is a bit of string fastened through a little hole. These serve occasionally as knives, and are probably used in carving. The only iron tools seen among them, and which they possessed before our arrival, were a piece of iron hoop, about the length of two inches, fitted into a wooden handle; and another edge-tool, which we supposed to have been made of the point of a broad sword. Their having the actual possession of these, and their being well acquainted with the use of this metal, inclined some of our people to imagine, that we were not the first European visitors of these islands. But the very great surprise which they testified on seeing our ships, and their perfect ignorance of the use of fire-arms, cannot be reconciled with such an opinion. There are several means by which such people may obtain pieces of iron, or acquire the knowledge of the existence of that metal, without having had an immediate connection with those nations that use it. We doubt not, that it was unknown to all the inhabitants of the Pacific Ocean, till Magellan led the way into it; for no navigator, immediately after his voyage, found any of this metal in their possession; though, in the course of our late voyages, it has been remarked, that the use of it was known at several islands, which no former European vessels had ever, to our knowledge, visited. At all the places where Mendana touched, during his two voyages, some of it must have been left; and this would, doubtless, extend the knowledge of it to all the various islands, with which the people, whom he visited, had any immediate intercourse. It might even have been carried farther, and where specimens of this valuable article could not be met with, descriptions might, in some degree, serve to make it known afterwards, when seen. The next voyage to the southward of the Equator, in which any intercourse was had with the people who inhabit the islands of this ocean, was that of Quiros, who landed at Sagitaria, the island of handsome people, and at Tierra del Espiritu Santo, at all which places, as well as at those with which they had any communication, it must undoubtedly have been made known. To him succeeded, in this navigation, Le Maire, and Schouten, whose connections with the natives began much farther to the Eastward, and terminated at Cocos and Horn islands. It is certain, that the inhabitants of Otaheite and the Society Isles, had a knowledge of iron, and purchased it with the greatest avidity, when Captain Wallis discovered Otaheite; and they could only have acquired this knowledge through the mediation of those neighbouring islands at which it had been originally left. They acknowledge, indeed, that this was really the case; and they have since informed us, that they held it in such estimation, before the arrival of Captain Wallis, that an Otaheitean chief, who had gained possession of two nails, received no small emolument, by letting out the use of them to his neighbours, for the purpose of boring holes. The natives of the Society Isles, whom we found at Wateoo, had been driven to that place long after the knowledge and use of iron had been thus introduced among their countrymen; and though, perhaps, they had no specimen of it with them, they would naturally communicate at that island, by description, their knowledge of this useful metal. From the people of Wateoo, again, those of Harvey's island might derive that inclination for it, of which we had sufficient proofs during our short intercourse with them. The consideration of these facts will shew how the knowledge of iron has been conveyed throughout the Pacific Ocean, to islands that have never had an immediate connection with Europeans; and it may easily be imagined, that, wherever the history of it only has been reported, or a very inconsiderable quantity of it has been left, the greater eagerness will be shewn by the inhabitants to procure plentiful supplies of it. The application of these particulars, to the object of our present consideration, is manifest. The natives of Atooi and Oneehow, without having ever been visited by Europeans before us, might have received this metal from intermediate islands, situated between them and the Ladrões, which the Spaniards have frequented almost ever since the pe-

riod of Magellan's voyage. Or, if the distant western position of the Ladrões, should detract from the probability of this solution, is there not the American continent to windward, where the Spaniards have been settled for upwards of two centuries and a half, during which long space of time shipwrecks must frequently have happened on its coasts? It cannot be deemed surprising, that part of such wrecks, containing iron, should, by the easterly trade winds, be occasionally cast upon some of those islands that are scattered about this immense ocean. The distance of Atooi from America is no argument against this supposition; and even if it were, it would destroy it. This ocean is annually traversed by Spanish vessels, and it is highly probable that, besides the accident of losing a mast and its appendages, casks with iron hoops, and many other things that contain iron, may fall, or be thrown, overboard, during so long a passage, and thus find their way to land. These are not mere conjectures, for one of Captain Cook's people actually saw some wood in a house at Wymoa, which he supposed to be fir: it was worm-eaten, and the natives informed him, that it had been driven ashore by the waves; and we had their own express authority, that they had obtained, from some place to the eastward, the specimens of iron found among them. From this digression (if it can justly be called one) let us return to the observations made during our continuance at Atooi.

The canoes of these people are commonly about four and twenty feet in length, and have the bottom, in general, formed of a single piece of wood, hollowed out to the thickness of an inch, or more, and brought to a point at each end. The sides are composed of three boards, neatly fitted and lashed to the bottom. The extremities both at head and stern, are a little elevated, and both are made sharp, somewhat resembling a wedge, but they flatten more abruptly; so that the two side boards join each other, side by side, for upwards of a foot. As they seldom exceed a foot and a half in breadth, those that go single (for they sometimes join them) have out-riggers, which are shaped and fitted with more judgment than any we had seen before. They are rowed by paddles, such as we had observed at other islands, and some of them have a light triangular sail, extended to a mast and boom. The ropes which they use for their boats, and the smaller cords for their fishing tackle, are strong and neatly made. They are by no means novices in the art of agriculture. The vale-ground is one continued plantation of taro, and some other articles, which have all the appearance of being carefully attended to. The potatoe-fields, and spots of sugar cane, or plantains, on the higher grounds, are planted with great regularity; but neither these, nor the others, are enclosed with any fence, unless we consider the ditches in the low grounds as such, which, it is more than probable, are designed to convey water to the taro. The abundance and excellence of these articles may, perhaps, be as much owing to skilful culture, as the natural fertility of soil, which seems better adapted to them than to bread-fruit and cocoa-nut trees; the few of these latter we saw not being in a thriving state: and yet, notwithstanding this skill in agriculture, the island, from its general appearance seemed to be capable of more extensive improvement, and of maintaining twice as many inhabitants as are now upon it; for those parts that now lay waste are, apparently, as good a soil, as those that are cultivated. Hence we cannot but conclude, that these people do not increase in that proportion, which would render it necessary for them to take advantage of the extent of their island, towards raising a greater quantity of its vegetable productions for their maintenance.

During our stay in these parts, we did not see one chief of any note; but we were informed by the islanders, that several at Atooi have their residence, to whom they prostrate themselves as a mark of homage and respect. This prostration appeared similar to the *moe moea*, paid to the chiefs at the Friendly Islands, and is here denominated *hamoea*, or *moe*. After we had left this island, one of these great men visited Captain Clerk,

going off to the Discovery, in his double canoe, and, like the sovereign of the Friendly Isles, paid no regard to the small canoes that chanced to be in his way, but ran against, or over them, without making the least attempt to avoid them: nor was it possible for the poor people to avoid him, it being a necessary mark of their submission, that they should lie down till he had passed. He was assisted in getting on board the Discovery by his attendants, who placed him in the gang-way, where they stood round him, holding each other by the hands, nor would they suffer any one but Captain Clerke to approach him. He was a young man, apparelled from head to foot. His name was said to be Tamahano. Captain Clerke having made him some presents, received, in return, a large bowl, supported by two figures of men, the carving whereof displayed a degree of skill, both with respect to the design and execution. This bowl used to be filled with Kava, or, in the language of Otaheite, Ava, which is prepared and drank here, as at the other islands of the Pacific ocean. Captain Clerke could not prevail upon this chief to go below, nor to move from the spot where his attendants had first placed him. After remaining some time in the ship, he was carried back into his canoe, and returned to the island. The next day several messages were sent to Captain Clerke, inviting him to return the visit on shore, and giving him to understand, that the chief had prepared a considerable present on the occasion; but the Captain being anxious to get out to sea, and join the Resolution, did not think proper to accept of the invitation.

Our imperfect intercourse with the natives did not enable us to form an accurate judgment of the form of government established among them; but from the general similarity of customs, and particularly from what we observed of the honours paid to their chiefs, it seems reasonable to imagine, that it is of the same nature with that which prevails in all the islands we had hitherto visited; and, in all probability, their wars among themselves are equally frequent. This, indeed, might be inferred, from the number of weapons we found in their possession, and from the excellent order in which they kept them. But we had proofs of the fact from their own confession; and, as we were informed, these wars are carried on between the different districts of their own island, as well as between it and the neighbouring inhabitants of the isles of Onceheow and Orechoua.

Besides their spears, formed of a fine brownish wood, beautifully polished, some of which are barbed at one end, and flattened to a point at the other, they have another kind of weapon, which we had never met with before. It somewhat resembles a dagger, and is, in general, about eighteen inches in length, sharpened at one or both ends, and secured to the hand by a string. Its use is to stab in close combat, and seems well adapted to that purpose. Some of these may be denominated double daggers, having a handle in the middle, with which they are the better enabled to strike different ways. They have likewise bows and arrows; but, both from their slender construction, and their apparent scarcity, it is probable that they never make use of them in battle. The knife or saw, already mentioned, with which they dissect the dead bodies of their enemies, may also be ranked among their weapons, as they both strike and cut with it when engaged in close fight. It is a small wooden instrument, about a foot in length, of an oblong shape, rounded at the corners: its edges are surrounded with shark's teeth, strongly fixed to it, and pointed outwards; and it has generally a hole in the handle, through which passes a long string, and this they wrap several times round the wrist. We are of opinion that, on some occasions, they use slings, for we procured some pieces of the hematites, or blood-stone, made artificially of an oval form, divided longitudinally, with a narrow groove in the middle of the convex part. To this the person who had one of them applied a thin cord, but would not dispose of it, though he was not unwilling to part with the stone, which, as it weighed a pound, must prove fatal when thrown with

some degree of force. We likewise saw some pieces of whetstone nearly polished, of an oval figure, but somewhat pointed towards each end, nearly resembling in shape some stones seen by Captain Cook at New Caledonia in 1774, and made use of there in slings.

Some of their religious institutions, and their method of disposing of their dead, strongly indicate an affinity between the manners of these people, and of the natives of the Friendly and the Society islands. The inhabitants of Tongataboo bury their dead with great decency, and they also inter their human sacrifices; but they do not, to our knowledge, offer any other animal, or even vegetable, to their deities. The Otaheiteans do not inter their dead, but expose them to waste and putrefaction, though they afterwards bury the bones; and this being their custom, it is remarkable, that they should inter the bodies of their human sacrifices. They are far from being attentive to the condition of the places, where they celebrate their solemn rites; most of their morais being in a ruinous state, and shewing manifest tokens of neglect. The people of Atooi resemble also those of Otaheite, in offering vegetables and animals to their Gods. The Taboo likewise prevails in Atooi in its full extent, and apparently with greater strictness, than even at Tongataboo: for the natives always asked here, with great eagerness, and with indications of fear of offending, whether any particular thing, which they desired to see, was taboo, or, as they pronounced the word, tafoo? The maia raä, or prohibited articles, at the Society islands, though undoubtedly the same thing, did not appear to be so rigorously observed by them, except with regard to the dead, respecting whom we thought they were more superstitious than any others we had been conversant with. But whatever resemblance we might discover between the general manners of the inhabitants of Atooi, and those of Otaheite, these were less striking than the similarity of language.

The languages of both places may indeed be said to be almost entirely the same. The people of Atooi, in general, have neither the strong guttural pronunciation of the New-Zealanders, nor that smaller degree of it, which also distinguishes the Friendly Islanders; and they have not only adopted the whole idiom of their language, but the same measure and cadence in their songs. It is true, at first hearing, a stranger may perceive some disagreement; but it should be considered, that the natives of Otaheite, from their frequent connections with the English, had learned, in some measure, to adapt themselves to our imperfect knowledge of their language, by using the most common and even corrupted expressions in conversation with us; whereas, when they talked with each other, and used the several parts necessary to propriety of speech, they were hardly at all understood by those among us, who had made the greatest progress in the knowledge of their tongue.

Had the Sandwich Islands been discovered at an early period, by the Spaniards, they would doubtless have availed themselves of so excellent a situation, and have made use of Atooi, or some other islands, as a place of refreshment for the ships that sail annually between Manilla and Acapulco. They lie almost midway between the last mentioned place and Guam, one of the Ladrões, which is at present their only port in traversing this vast ocean; and to touch at them would not be a week's sail out of their ordinary rout. An acquaintance with the Sandwich Isles would also have been equally favourable to our Buccaneers, who have sometimes passed from the coast of America to the Ladrões, with a stock of provisions and water scarcely adequate to the support of life. Here they might always have met with a plentiful supply, and have been within a month's sail of the very part of California, which the Manilla ships are obliged to make. How happy would Lord Anson have been, and what difficulties would he have avoided, had he known that there was a cluster of islands half way between America and Tinian, where all his wants might have been effectually relieved!

At these islands, the tides are so inconsiderable, that

with a great surf breaking against the shore, it was difficult, at all times to determine whether we had high or low water, or whether it ebbed or flowed. On the south side of Atooi, a current generally set to the westward, or north-westward: but when we were at anchor off Once-heow, we found a current setting nearly N. W. and S. E. six hours each way. This was doubtless a regular tide, and the flood appeared to come from the N. W.

The longitude of Sandwich Islands, was determined by 72 sets of lunar observations; some of which were made while we were at anchor, in the road of Wymoa; others, before we arrived and after we had left it, and reduced to it, by the watch or time-keeper. By the mean result of the observations, the longitude of the road is 200 deg. 13 min. E. and the latitude, by the mean of two meridian observations of the sun 21 deg. 56 min. 15 sec. N. We now return to the progress of our voyage.

On Monday, the 2nd of February, the Discovery having joined us, we stood away to the northward, with a gentle gale from the E. On the 7th we were in the latitude of 29 deg. N. longitude 200 deg. E. the wind having veered to the S. E. which enabled us to steer N. E. and E. This course we continued to the 12th, when the wind having changed, we tacked, and stood to the northward, in latitude 30 deg. N. longitude 206 deg. 15 min. E. In this advanced latitude, and even in the winter season, we had only begun to feel a sensation of cold in the mornings and evenings; a proof of the equal and durable influence of the heat of the sun, at all times, to 30 degrees on each side the line. After that, the disproportion is known to be very great. This must be attributed principally to the direction of the sun's rays, independent of the bare distance, which is not equal to the effect. On Thursday the 19th, being in latitude 37 deg. N. longitude 206 deg. E. the wind veered to the S. E. and we were again enabled to steer to the E. inclining to the N. On the 25th, we reached the latitude of 42 deg. 30 min. longitude 219 deg. when we began to meet with the rock-weed, mentioned in Lord Anson's voyage, by the name of the sea-leek, which is generally seen by the Manilla ships. Since we left Sandwich Islands, we had scarcely beheld a bird, or any other oceanic animal.

On Sunday, the 1st of March, in latitude 44 deg. 49 min. N. and in longitude 228 deg. E. we had moderate and mild weather, which appeared to us very extraordinary, when we were so far N. and so near an extensive continent, at this time of the year. Another singular circumstance is, that we should meet with so few birds, compared to those we saw in the same latitudes, to the S. of the line. Hence we may conclude, that, in the southern hemisphere, beyond 40 deg. the species are much more numerous, and the islands more plentifully scattered, than any where near that latitude, between the coast of California and Japan. On the morning of the 2nd, during a calm, part of the sea appeared to be covered with a kind of slime, and small sea animals. When they swam about, which they did with ease in various directions, they emitted the brightest colours of the most valuable gems, according to their position, respecting the light. Some of them were taken up and put into a glass of salt water, when, at one time, they appeared pellucid, at another displaying the various tints of blue, from a pale saphirine to a violet, mixed with a kind of ruby, and glowing with sufficient strength to illuminate the glass of water. When the vessel was held to the strongest light, the tints appeared most vivid; but almost vanished when the animals subsided to the bottom, and they had then a brownish appearance. By candle-light, the colour was, principally, a beautiful pale green, with a kind of burnished gloss; and, in the dark, it faintly exhibited a glowing fire. They are a new species of *Oniscus*, called by Mr. Anderson, *Oniscus fulgens*, and supposed to be an animal which contributes to that lucid appearance often observed at sea in the night.

On Friday the 6th, at noon, in latitude 44 deg. N. longitude 234 deg. 30 min. E. we saw two seals, and se-

veral whales; and on the 7th, early in the morning, the long expected coast of New Albion, so named by Sir Francis Drake, was descried, at the distance of ten leagues extending from N. E. to S. E. At noon we were in latitude 44 deg. 33 min. N. longitude 235 deg. 20 min. E. and the land about eight leagues distant. This formed a point at the northern extreme, which our Commodore named Cape Foulweather, from the exceeding bad weather we afterwards met with. After several attempts attended with many difficulties, on Monday the 9th, we tacked, and stood in again for the land; but the wind continually shifting, and blowing in squalls, with hail and sleet, obliged us to stand off and on, without seeing the least sign of a harbour. The land which we approached on our different tacks, is moderately high, but, in many places, it rises still higher within. It is diversified with hills and rising grounds, many of which are covered with tall straight trees; and others, not so high, grew in spots, like clumps; but the spaces between, and the sides of the rising grounds were clear. Such a prospect in summer might be very agreeable, but at this season, it had an uncomfortable appearance, the bare grounds along the coast being covered with snow, which seemed to lie in abundance between the hills and rising grounds, and in many places, towards the sea, had, at a distance, the appearance of white cliffs. On the rising grounds, the snow was thinner spread; and farther in land, there seemed to be none at all. Hence it might, perhaps, be concluded, that the snow which we had seen towards the sea, had fallen the preceding night; which was, indeed, the coldest we had experienced since our arrival on that coast; a kind of sleet fell sometimes; and the weather became very unsettled. The coast appeared almost straight in every part, not having any opening or inlet, and terminated in a kind of sandy beach; though it was imagined by some on board, that such appearance was owing to the snow. Each extreme of the land shot out into a point; the northern one was that which we had seen on the 7th, and therefore the Captain called it Cape Perpetua. Its latitude is 44 deg. 6 min. N. and its longitude 235 deg. 52 min. E. The southern extreme was named Cape Gregory. It lies in the latitude of 43 deg. 30 min. N. and in the longitude of 235 deg. 57 min. E. At five o'clock the wind veered to the W. and S. W. which induced us once more to stand out to sea. At this time Cape Perpetua bore N. E. by N. and the farthest land to the S. of Cape Gregory S. by E. distant about ten or twelve leagues: consequently, its latitude is 43 deg. 10 min. and its longitude 235 deg. 55 min. E. This is nearly the situation of Cape Blanco, discovered the 19th of January 1603, by Martin d'Aguiar. It is remarkable that in this very latitude, geographers have placed a large entrance or strait, ascribing the discovery of it to the same navigator; whereas nothing more is mentioned in his voyage, than his having discovered a large river in this situation, which he would have entered, but was hindered by the currents.

The wind being now very unsettled, blowing in squalls, attended with snow showers, we were obliged to stretch to the southward to get clear of the coast. On Friday, the 13th, the gale abated, and we stood in again for land. On Saturday, the 21st in the morning, a breeze sprung up at S. W. This being attended with fair weather, we steered north-easterly; and on the 22nd, about eight o'clock A. M. we came in sight of land, distant about nine leagues, being now in latitude 47 deg. 5 min. N. and our longitude 235 deg. 10 min. E. At length we perceived a small opening between what we supposed to be an island, and the northern extreme of the land; here we expected to find a harbour; but our hopes vanished as we drew nearer; and, we were soon convinced, that the opening was closed by low land. Our disappointment occasioned the point of land, to the north, to be named Cape Flattery. Its latitude is 48 deg. 15 min. N. and its longitude 235 deg. 3 min. E. In this latitude geographers have placed the pretended strait of Juan de Fuca. But nothing of that kind presented itself to our view, nor is it probable that any such thing ever existed.

On

On Sunday, the 29th, we were in latitude 49 deg. 29 min. N. and in the longitude of 232 deg. 29 min. E. when we again saw land, the nearest part six leagues distant. A low point is formed, at the S. E. extreme, off which are several breakers, on account of which it was called Point Breakers. Its latitude is 49 deg. 15 min. N. and its longitude 233 deg. 20 min. E. The latitude of the other extreme is about 50 deg. and the longitude 232 deg. This last was named Woody Point. Between these two points, a large bay is formed, which the Captain called Hope Bay; hoping, as he said, to find in it a good harbour; and the event proved that he was not mistaken. As we approached the coast, we saw the appearance of two inlets; one of which was in the N. W. and the other in the N. E. corner of the bay. We bore up for the latter, and passed some breakers about a league from the shore. As we advanced, the existence of the inlet no longer remained doubtful. At five o'clock we reached the west point of it; and soon after a breeze sprung up at N. W. with which we stretched into an arm of the inlet, running in to the N. E. Here we were becalmed, and found it necessary to anchor in eighty-five fathoms water, and so near the shore as to be able to reach it with a hawser. The Discovery was becalmed before she got within the arm, where she anchored in 75 fathoms.

At the place where we were first becalmed, three canoes came off to the ship, in one of which were two men, in another six, and in the other ten. Advancing pretty near us, a person stood up in one of them, and spoke for a considerable time, inviting us, as we supposed, by his gestures to go ashore; and, at the same time continued strewing handfuls of feathers towards us. Some of his companions also threw a red powder in the same manner. One, in particular, sung a most agreeable air, accompanied with a melodious softness. The word *haela* was repeated frequently as the burden of the song. Soon after a breeze springing up brought us closer to the shore, when the canoes came to visit us in great numbers; having, at one time, no less than thirty-two of them about the ship, containing from three to seven or eight persons each, and of both sexes. One attracted particularly our notice, by its having a peculiar head, with a bird's eye, and an enormous large beak, painted upon it. The chief who was in it, appeared equally remarkable for his singular appearance; having a large quantity of feathers hanging from his head, and being dressed in a very extraordinary manner. In his hand he had a carved bird of wood, of the size of a pigeon, with which he often rattled, like the person before mentioned; and was equally vociferous in his harangue, which was accompanied with many expressive gestures. Not any of these visitors could be prevailed upon to come on board. They were very ready, however, to part with any thing they had, and received whatever we offered them in exchange; but they were very solicitous after iron, and appeared to be no strangers to that valuable metal.

Having found such excellent shelter for our ships, in an inlet whose coasts appeared to be inhabited by an inoffensive race of people, we lost no time, after coming to anchor, in searching for a commodious harbour, where we might be stationed during our continuance in the sound. Upon this service three armed boats were sent; and on the N. W. of the arm, at a small distance from the ships, we found a convenient cove: but apprehending we could not transport our ships to it, and moor them properly, before night had overtaken us, we thought it prudent to continue where we were till the next morning. The whole day we were surrounded with plenty of canoes; and a reciprocal trade was commenced between us, conducted with the strictest harmony and integrity on both sides. Their articles of commerce were the skins of various animals, such as bears, sea-otters, wolves, foxes, deer, racoons, martins, and pole-cats. They also produced a kind of cloathing, fabricated from the bark of a tree, or a plant resembling hemp: besides which articles,

they had bows, arrows, and spears; fish-hooks, and various kinds of instruments; wooden vizors, representing horrid figures; a sort of woollen stuff; carved work; beads; and red ochre; also several little ornaments of thin brass and iron resembling an horse-shoe, which they wear pendant at their noses. However, among all the articles which they exposed to sale, the most extraordinary were human skulls, and hands, with some of the flesh remaining on them; which they acknowledged they had been feeding on; and some of them, indeed, bore evident marks of their having been on the fire. For the various articles they brought, they received in exchange knives, chisels, nails, looking glasses, buttons, or any kind of metal. They had not much inclination for beads, and rejected every kind of cloth.

On Tuesday, the 31st, we were employed in hauling the ships into the cove, where they were moored. The Resolution was now become very leaky in her upper works; on which account the carpenters were ordered to caulk her, and to repair any other defects they might discover. In the course of this day, the news of our arrival brought vast numbers of the natives about our ships. At one time we counted above a hundred canoes, each of which, on an average, had five people on board; few containing less than three; many having seven, eight, or nine; and one was manned with seventeen. Many of these were new visitors, which we discovered by their orations and ceremonies. If they, at first, had apprehended that we meant to be hostile, their fears were now removed; for they ventured on board the ships, and mixed with our people with the utmost freedom and familiarity. We discovered, however, by this intercourse, that they were as fond of pilfering as any we had met with during our voyage; and they were much more mischievous than any of the other thieves we had found; for, having sharp instruments in their possession, they could, the instant that our backs were turned, cut a hook from a tackle, or a piece of iron from a rope. They stripped our boats of every piece of iron that was worth taking away, though some of our men were always left in them as a guard. They were, indeed so dextrous in effecting their purposes, that one fellow would contrive to amuse our people at one end of the boat, while his confederate was forcing off the iron work at the other. If an article that had been stolen, was immediately missed, the thief was easily detected, as they were fond of impeaching each other: but the prize was always reluctantly given up by the guilty person; and sometimes compulsive means were obliged to be used in order to regain it.

Wednesday, April the 1st, having safely moored our ships, we proceeded to other necessary business. The observatories were taken ashore, and placed on a rock, on one side of the cove. A party of men was stationed to cut wood, and clear a place for watering. Having plenty of pine-trees here, others were employed in brewing spruce-beer. The forge was also erected to make the necessary iron-work for repairing the foremast. We were daily visited by a considerable number of new comers, who had a singular mode of introducing themselves on their first appearance, by paddling, with their utmost strength and activity, round both the ships, while a chief, standing up with a spear in his hand, bawled most vociferously all the time. The face of this orator was sometimes covered with a mask, representing either a human countenance, or that of some other animal; and, instead of a spear, he had a kind of rattle in his hand. Frequently, before they came along side, or on board our ship, they would entertain us with a song, in which their whole company joined. During these visits our principal care was to guard against their thievery.

But on Saturday, the 4th of April, we had a very serious alarm, for our party on shore perceived the natives in all quarters arming, and those who had not proper weapons were collecting sticks and stones. The Captain, hearing this, ordered all our workmen to repair to the rock, whereon our observatories had been placed; thus leaving the supposed enemy in possession of the ground where they assembled, which was within about

about one hundred yards of our stern. We soon found, however, that these hostile preparations were directed against a body of their own countrymen, who were advancing to attack them; and our friends of the Sound, perceiving our apprehensions, exerted their best endeavours to convince us, that this was really the case. The adverse party, on board about twelve large canoes, at length drew up in line of battle, off the South point of the cove. A negotiation for the restoration of peace was now commenced; in the course of which several people in canoes passed between the two parties, and some debates ensued. At length the matter in dispute appeared to be adjusted; but the strangers were not permitted to approach our ships. It is most likely we were the principal occasion of the quarrel; the strangers, perhaps, insinuating on having a right of sharing in the advantages of a trade with us; and our first friends resolving to engross us entirely to themselves. We were convinced of this on many other occasions; nay, even among those who lived in the sound, the weaker were often obliged to submit to the stronger party, and were plundered of every thing, without even attempting to make any resistance.

Sunday, the 5th, the carpenter discovered the cheeks of the foremast to be rotten, and began to supply it with new ones. It was fortunate that these defects should be discovered, when we were so commodiously situated, as to be able to procure the materials that were requisite. On the 7th, while the fore-mast was repairing, the Captain ordered a new set of main-rigging to be fitted. From our putting into the sound to this day, the weather had been remarkably fine; but in the morning of the 8th we had rain with a fresh gale, and in the evening it blew extremely hard: but though these tempestuous blasts succeeded each other quickly, they were of short duration: yet we had the misfortune to have our mizen-mast give way at the head. About eight o'clock, the gale abated, but the rain continued, almost without intermission. During these squalls the natives frequently brought us small cod, small bream, or sardine, and a supply of other fish. Sunday the 12th, in the evening, we received a visit from a tribe of natives, whom we had not seen before, and who, in general, made a better appearance than our old friends. When conducted into the cabin, there was not an object that fixed their attention; all our novelties were looked on with indifference, except by a very few, who shewed a certain degree of curiosity. On Thursday the 16th, when our carpenters had made a considerable progress on the mizen-mast, they discovered that the tree on which they were at work, was wounded, owing, it was imagined, to some accident in cutting it down. It therefore became necessary to procure another tree out of the woods, on which work all hands were employed about half a day. During this operation, many of the natives were gazing on with an inexpressible surprize, which, from their general inattention, we did not expect. On Saturday, the 18th, a party of strangers, in seven or eight canoes, came into the cove, and after looking at us for some time, retired. We concluded, that our old friends would not suffer them to have any dealings with us. It was evident, indeed, that the neighbouring inhabitants engrossed us entirely to themselves; and that they carried on a traffic with more distant tribes, in those articles they had received from us: for they frequently disappeared four or five days together, and returned with fresh cargoes of curiosities and skins. Such of them as visited us daily, after having disposed of their trifles, employed themselves in fishing, and we always partook of what they caught: we also procured from them a considerable quantity of good animal oil, which they brought to us in bladders. Some, indeed, attempted to cheat us, by mixing water with oil; and once or twice they so far imposed upon us, as to fill their bladders with water only. In exchange for their articles of traffic, metal was generally demanded by our visitors; and brass had now supplanted iron, being sought after, with such eagerness, that before we left the sound, scarcely a bit of it was to be found in the ships, except what constituted

a part of our necessary instruments: suits of cloaths were stripped of their buttons; bureaus of their furniture; kettles, cannisters, and candlesticks, all went to rack; so that our American friends procured from us a greater variety of things, than any other nation we had visited.

On Sunday, the 19th, most of our work being now finished, Captain Cook set out the next morning to survey the sound. Proceeding first to the west point, we discovered a large village, and, before it a very snug harbour, with from nine to four fathoms water. The inhabitants of this village, who were numerous, and to many of whom the Commodore was no stranger, received him with great courtesy, every one pressing him to enter his apartment; for several families have habitations under the same roof. He accepted politely the invitations, and the hospitable friends whom we visited, testified every mark of civility and respect. In many of these habitations women were employed, in making dresses of the bark or plant already mentioned, and executed their business much like the natives of New Zealand: others were busy in opening sardines; large shoals of which we have seen brought on shore, and measured out to several people, who carried them home, where they performed the operation of curing them: this is done by smoke-drying. They are hung upon small rods; at first, about a foot over the fire; they are then removed higher and higher, to make room for others. When dried, they are closely packed in bales, and the bales covered with mats. Thus they are preserved till wanted, and are not unpleasant food. They also cure cod, and other large fish in the same manner; but these are sometimes dried in the open air. Leaving this village, we proceeded up the west side of the sound. For near three miles we saw several small islands, so situated as to form some convenient harbours, the depths being from thirty to seven fathoms. About two leagues within the sound, on the same side, an arm runs in the direction of N. N. W. and another in the same direction about two miles farther. About a mile above the second arm we found the ruins of a village. The framings of the houses remained standing, but the boards or roofs were taken away. Behind this deserted village is a small plain, covered with the largest pine-trees we had ever seen. This was singular, as most of the elevated ground on this side the sound appeared rather naked. Passing from hence to the east side, we observed, what we had before imagined, that it was an island, under which the ships lay; and that many smaller ones lay scattered about on the west side of it. Upon the main land, opposite the north end of our island, we saw a village, and landed there, but our Commodore was not so politely received by the inhabitants, as by those of the other village he had visited. This cold reception was occasioned by one surly chief, who would not suffer him to enter their houses, making expressive signs, that he was impatient for him to be gone. Captain Cook endeavoured in vain to soothe him with presents: these he did not refuse, though he continued the same kind of behaviour. But, notwithstanding this treatment from the inhospitable chief, some of the young women expeditiously apparelled themselves in their best habiliments, assembled in a body, and, joining in an agreeable song, gave us a hearty welcome. Evening now drawing on, Captain Cook proposed returning, and we proceeded for the ships round the north end of the island. When returned aboard, we were informed that in our absence, some strangers from the S. E. had visited our people in the ships, who purchased of them two silver table spoons, that appeared to be of Spanish manufacture. They were worn round the neck of one of those visitors by way of ornament.

Wednesday, the 22nd, about eight o'clock A. M. we were visited by a number of strangers from the southward. After their departure the two Captains, Cook, and Clerk, went in their own boats to the village at the west point, where our Commodore had been two days before, and had observed that plenty of grass was to be had near it; and it was necessary to get a supply

of this, for the few remaining goats and sheep that were still on board. We received the same welcome reception as before, and our Commodore ordered some of the people to begin cutting: not imagining the natives would object to our furnishing ourselves with what could not be of any use to them, though essentially necessary for us. In this, however, we were mistaken, for as soon as our men began cutting the grafs, some of the inhabitants would not permit them to proceed, saying, "Makook," signifying, that we must buy them first. During this event, Captain Cook was in one of the houses, but, hearing of it, he repaired immediately to the field, where he found about us, a dozen claimants of different parts of the grafs, that grew on the premises. The Commodore treated with them for it, and having complied with the terms of his purchase, thought we had now full liberty to cut whatever we pleased. Here he was again mistaken; for he had so liberally paid the first pretended proprietors, that fresh demands were made from others, so that every single blade of grafs might have had a separate owner; and so many of them were to be satisfied, that his pockets presently became empty. When they were convinced of this last striking circumstance, they ceased to be importunate, and we were permitted to cut where we thought proper, and as much as we pleased. Here it is worthy of observation, that we never met with any uncivilized nation, or tribe, who possessed such strict notions of their having an exclusive property in the produce of their country, as the inhabitants of this sound. They even wanted our people to pay for the wood and water that were carried aboard. Had Captain Cook been present when these demands were made, he would doubtless have complied with them; but our workmen thought differently, and paid little or no attention to such claims. The natives thinking we were determined to pay not the least consideration, at length ceased to apply for the same: but they frequently took occasion to remind us, that their esteem for us had induced them to make us a present of wood and water. Having completed all their operations at this village, the natives and the two Captains took a friendly leave of each other, and we returned to the ships in the afternoon.

The 23d, 24th, and 25th, were employed in preparing for sea; the sails were bent; the observatories and other articles were removed from the shore; and both ships put into a proper condition for sailing. On Sunday the 26th, the Commodore intended to have set sail, but having both wind and tide against us, we were under a necessity of waiting till noon, when the tide turning in our favour, the ships were towed out of the cove. At four o'clock P. M. the mercury in the barometer sunk uncommonly low, and we had every appearance of an approaching storm from the southward: but the Captain's anxiety to prosecute the voyage, and the fear of losing so good an opportunity of getting out of the sound, operated more strongly upon his mind than the apprehension of danger, and he resolved to put to sea. We were attended by the natives till we were almost out of the sound; some in their canoes, and others on board the ships. One of the chiefs who had particularly attached himself to Captain Cook, was among the last who parted from us. The Captain a little time before we got under way, made him a small present; for which he received, in return, a beaver skin of much superior value. For this reason the Captain made an addition to his present, which pleased the chief so highly, that he presented to the Commodore the beaver-skin cloak which he then wore, and of which he was particularly fond. Struck with this instance of generosity, and wishing him not to be a sufferer by his gratitude, Captain Cook insisted upon his acceptance of a new broad-sword, with a brass hilt, with which he appeared greatly delighted. We were earnestly importuned by the chief, and many of his countrymen, to pay them another visit; who, by way of inducement, promised to procure a large stock of skins. Before we continue the progress of our voyage, we think it may be no small entertainment to our readers, to comprise in the re-

mainder of this chapter further particulars relative to the country and its inhabitants.

The inlet in which our ships were moored is called by the natives Nootka, but Captain Cook gave it the name of King George's Sound. The entrance is in the east corner of Hope Bay, in latitude 49 deg. 33 min. N. longitude 233 deg. 12 min. E. The east coast is covered by a chain of sunken rocks, and, near the sound, are some islands and rocks above water. We enter the sound between two rocky points, lying E. S. E. and W. N. W. from each other, distant four miles. The sound widens within these points, and extends to the northward at least four leagues. In the middle of it are a number of islands of various sizes. The depth of water, not only in the middle of the sound, but also close to some parts of the shore, is from 47 to 90 fathoms or more. Within its circuit, the harbours and anchoring places are numerous. The cove, where our ships anchored, is on the east side of the sound, and also on the east of the largest island. Its principal recommendation is that of being covered from the sea; for it is exposed to the S. E. winds, which sometimes blow with great violence. Upon the sea coast, the land is tolerably high; but, within the sound, it rises into steep hills, which have a uniform appearance, ending in roundish tops, with sharp ridges on their sides. Many of these hills are high; all of them are covered to their summits with the thickest woods. The soil upon them is produced from rotten mosses and trees, of the depth of about two feet. Their foundations are nothing more than stupendous rocks; of a grey or whitish cast when exposed to the weather; but, when broken, are of a bluish grey colour. The rocky shores consist entirely of this; and the beaches of the little coves in the sound are composed of fragments of it.

The climate appears to be infinitely milder than that on the east coast of America, under the same parallel of latitude. We perceived no frost in any of the low ground; but, on the contrary, vegetation proceeded very briskly, for, at this time, we saw grafs upwards of a foot long. The trees of which the woods are composed are the Canadian pine, white cypress, and two or three other sorts of pine. The two first are in the greatest abundance. At a distance they resemble each other; but they are easily distinguished on a nearer view, the cypress being of a paler green than the other. In general, the trees grow here with great vigour, and are of a large size. About the rocks and borders of the woods, we saw some strawberry plants, raspberry, currant, and gooseberry bushes, all in a flourishing state. We found also a few black alder-trees; a species of sownthistle; some crows-foot with a fine crimson flower, and two sorts of Anthericum. We met with some wild rose-bushes, just budding: some young leeks; a small sort of grafs, and some water-creffes; besides a great abundance of andromeda. The season of the year did not permit us to acquire much knowledge of the vegetables of this country; and being in a cove, on an island, all the animals that we saw alive were two or three racoons, martins, squirrels; and some of our people who landed on the continent, on the south-east side of the Sound, observed the prints of a bear's feet, not far from the shore; but we could only judge of the quadrupeds from the skins purchased of the inhabitants, and these were sometimes so mutilated, that we could not even guess to what species of animals they belonged, though others were so perfect as not to admit a doubt about them. The most common of these last sorts were bears, deer, foxes, and wolves. Bear-skins are in abundance, but not very large; their colour is generally a shining black. The deer-skins are not so plentiful, and appear to belong to what the inhabitants of North-Carolina in America, call the fallow-deer; but Mr. Millar, in his New System of Natural History distinguishes it by the name of Virginian deer, and thinks it quite a different species from ours. Our very numerous friends and subscribers will not be displeased if we here give a decisive opinion in favour of that Entire New, Cheap, and Capital Work, MILLAR'S REAL NEW

SKETCH

London. Published by Alex^r Hogg at the Kings Arms A^o 56 Paternoster Row.

London Published by J. Stagg at the Kings Arms, No. 10, Pall Mall.

NEW BODY of NATURAL HISTORY, to be compleated in sixty weekly numbers, price only sixpence each, and now publishing with universal approbation, may be said, without the least particle of flattery, to be far superior to every other publication of the kind. May merit alone ever have the preference and encouragement, with the unprejudiced and disinterested public, is our sincere and hearty wish! But to proceed. The foxes are numerous, and of several varieties; the skins of some being yellow, with a black tip at the tail; others of a reddish yellow, intermixed with black. We met with an entire wolf's skin, which was grey. Here is the common martin, the pine martin, and another of a lighter brown colour. The ermine in this country is small, and not very common: nor is its hair remarkably fine. The animal is entirely white, except about an inch at the tip of the tail. The racoons and squirrels are of the common species, but not so large as in other parts of the world. Hogs, dogs, and goats, have not yet made their appearance in this place.

The sea animals seen off the coast were whales, porpoises, and seals; the last of these seem only of the common sort. Though sea-otters are amphibious, yet we may consider them as belonging to this class, as living principally in the water. The fur of these animals, as mentioned in the Russian accounts, is certainly softer and finer than that of any other animals known by the Europeans; consequently the discovery of this part of the continent of North-America, where so valuable an article of commerce may be met with, cannot be a matter of indifference. Mr. Coxe, in his Russian Discoveries, on the authority of Mr. Pallas, says, that the old and middle-aged sea-otters skins are sold at Kiatchta, by the Russians, to the Chinese, from 80 to 100 rubles a skin, that is from 16l. to 20l. each.

The birds that frequent the waters and the shores are far from being numerous: they are very shy, owing, perhaps, to their being continually harassed by the natives, either to eat, or for their feathers to be worn as ornaments. We met with humming birds, different in some respects from the various sorts already known of this delicate little animal. Shags and gulls are also frequent in the Sound. Some swans too were seen flying to the northward, but we know not their haunts. Here are two sorts of wild ducks; one black, with a white head; the other white, with a red bill, but of a larger size: also the greater Lumme, or diver, found in the northern parts of Europe. On the shores we found a sand-piper, not unlike the burre, a plover, resembling our common lark, and two kinds of wood-peckers, one smaller than a thrush, the other larger and more elegant.

Fish are more plentiful than birds. The principal sorts we found were the common herring, not exceeding seven inches in length; a smaller sort, of the same kind with the anchovy, though rather larger: a silver coloured bream, and another of a brown colour, with narrow blue stripes. Sharks sometimes frequent the sound, for the natives have some of their teeth in their possession. About the rocks there is an abundance of large muscles, many of a span long; in some of which are large pearls; but they are not pleasing either in colour or shape. Red coral is to be found either on the coast or in the sound, large branches of it having been seen in the canoes of the natives. The only reptiles observed here were brown snakes, about two feet in length, having whitish stripes on the back and sides; and brownish water lizards. The former are quite harmless. The insect tribe seem to be much more numerous.

We found here both iron and copper, but we do not think either of them belong to this place. We did not see the ores of any metals, except a coarse red ochry substance, used by the natives in painting or staining their faces and bodies; they had also a black and white pigment made use of for the same purpose. Exclusive of the rock, which forms the shores and mountains, we found among the natives some things made of a hard black granite, not very compact, nor fine grained; also a greyish whetstone; the common oil stone; and a black sort, little inferior to the hone stone.

They had likewise pieces of rock chrystal. We could not obtain this from them without a very valuable return.

As to the natives, their persons, in general, are under the common stature; usually pretty plump, but not muscular; the forehead low; the eyes small, black, and rather languishing, than sparkling; the mouth round, with large, thick lips; the teeth tolerably equal and well set. Their eye-brows are also scanty, and always narrow: but the hair of the head is in great abundance, very coarse and strong; and, without a single exception, black, straight, and lank. Some have no beards; others only a thin one on the point of the chin; for they pluck it out elsewhere by the roots; and those who do not thus eradicate it, have not only considerable beards, on every part of the chin, but also whiskers, or mustachios, running from the upper lip to the lower jaw obliquely downward; whence we may conclude, that it is a mistaken notion, though espoused by eminent writers, that American Indians have no beards. The limbs, in all of them, are small in proportion to the other parts; besides they are crooked and ill-formed, having projecting angles, and large feet, awkwardly shaped. Their colour could never be determined positively, as their bodies were incrustated with paint and dirt. The women are nearly of the same size with the men, from whom it is not easy to distinguish them, as they possess no natural delicacies sufficient to render their persons agreeable. A certain sameness characterizes both sexes; dulness, and want of expression, being visibly portrayed in every visage. In common, their dress is a flaxen kind of mantle, ornamented with a narrow stripe of fur on the upper edge, and fringes at the lower one. Passing under the left arm, it is tied by tassels over the right shoulder. Sometimes they fasten the mantle round the waist with a girdle of coarse matting; over which is worn a small cloak of the same substance, fringed at the bottom, and reaching to the waist. They wear a cap, in shape of a flower-pot, made of very fine matting, ornamented with a bunch of leathern tassels, and having a string passing under the chin, to prevent its blowing off. Besides the above dress, which is common to both sexes, the men throw frequently over their other garments the skin of a bear, wolf, or sea-otter, with the hair outward, and tie it as a cloak, near the upper part, wearing it sometimes before, and sometimes behind. Was this dress kept clean, it would by no means be inelegant; but as they are continually rubbing their bodies over with a red paint, mixed with oil, their garments become greasy, and contract a rancid offensive smell. The appearance, indeed, of these people is both wretched and filthy, and their heads and garments swarm with lice. So lost are they to every idea of cleanliness, that we frequently saw them pick off these vermin, and eat them with the greatest composure. Their faces are ornamented with a variety of colours; a black, a brighter red, or a white colour: the last of these gives them a ghastly appearance. Over the paint they strew the brown martial mica, which causes it to glitter. Many of their ears are perforated in the lobe, where they make a large hole, and two smaller ones higher up on the outer edge. In these holes are hung bits of bone, quills fastened upon a leathern thong, shells, bunches of tassels, or thin pieces of copper. In some, the septum of the nose is also perforated, and a piece of cord drawn through it. Others wear, at the same place, pieces of copper, brass, or iron, shaped somewhat like a horse-shoe, the narrow opening receiving the septum, so that it may be pinched gently by the two points, and thus the ornament hangs over the upper lip. Their bracelets, which they wear about their wrists, are bunches of white bugle beads, or thongs with tassels, or a black, broad, horny, shining substance. Round their ankles they wear frequently leathern thongs, or the sinews of animals curiously twisted. Besides these, their ordinary dresses, they have some that are used only when going forth to war, and exhibiting themselves to strangers in ceremonial visits. Among these are the skins of bears or wolves, tied on like their other garments, but edged with broad borders of fur, ornamented ingeniously with various figures.

figures. They are worn separately, or over their common cloathing. The most usual head-dress, on these occasions, is a quantity of withe, wrapped about the head, with large feathers, particularly those of eagles stuck in it, or entirely covered with small white feathers. At the same time the face is variously painted, the upper and lower parts being of opposite colours, and the strokes having the appearance of large gashes; or it is besmeared with a kind of fat or tallow, mixed with paint, formed into a great variety of figures, somewhat like carved work. The hair, sometimes, is separated into small parcels, and tied, at intervals, with thread: others tie it behind, after the English fashion. Thus equipped, they have a truly savage and ridiculous appearance, which is much heightened when they assume their monstrous decorations. These consist of a great variety of wooden masks, applied to the face, forehead, or upper part of the head. Some of the visors resemble human faces, having hair, beards, and eyebrows; others represent the heads of birds, and various animals, such as deer, porpoises, wolves, &c. Such kind of representations exceed generally the natural size, and they are frequently strewed with pieces of the mica, which makes them glitter, and augments their deformity. In these imaginary decorations, they sometimes run into greater excess, and fix large pieces of carved work upon the head, projecting to a considerable distance, and resembling the prow of a canoe. Whether these extravagant masquerade ornaments are used on any religious occasion, or in any kind of diversion, or whether they are intended to intimidate by their monstrous appearance, or as decoys when hunting animals, is uncertain. One of the dresses seems peculiarly adapted to war: It is a thick tanned leathern mantle, double, and appears to be the skin of an elk, or buffalo. This is fastened on in the ordinary manner, and is so contrived as to cover the breast quite up to the throat; part of it, at the same time, falling down to their heels. This garment is curiously painted, and is strong enough, as we understood from them, to resist even spears; so that it may be considered as their completest defensive armour. Though we cannot view these people without a kind of horror, when they are thus strangely apparelled, yet when divested of these extravagant dresses, and beheld in their common habit, they seem to be of a quiet, phlegmatic disposition; though deficient in vivacity, to render themselves agreeable in society. They are rather reserved than loquacious; but their gravity seems constitutional, and not the result of any particular mode of education: for the orations made by them on public occasions, are little more than short sentences, or only single words, forcibly repeated in one tone of voice, accompanied with a single gesture at every sentence. From their offering human skulls and bones to sale, there is not the least reason to doubt of their treating their enemies with a savage cruelty; but, as this circumstance rather marks a general agreement of character among almost every uncivilized tribe, in every age and country, they are not to be reproached with any charge of peculiar inhumanity. We had not any reason to judge unfavourably of their disposition in this respect: they appear to be docile, courteous, and good-natured; but, notwithstanding their phlegmatic temper, they are quick in resenting injuries; yet, like all passionate people, they forget them quickly. It must be admitted, that they are not wholly insusceptible of the tender passions, which is evident from their being fond of music, and that too of the pathetic kind.

Their songs are generally slow and solemn. Sonnets were sung by single performers, keeping time by striking the hand against the thigh. A rattle, and a small whistle, are the only instruments of music which we saw among them. The rattle is used when they sing; but upon what occasions the whistle is employed, we know not, unless it be when they assume the figures of particular animals, and endeavour to imitate their howl or cry. We once saw one of these people dressed in the skin of a wolf, with the head covering his own, striving to imitate that animal, by making a squeaking noise with a whistle he had in his mouth. The rattles are ge-

nerally in the shape of a bird, with small pebbles in the belly, and the tail is the handle. We observed another sort, which resembles a child's rattle.

In trafficking with us, some of them displayed a disposition to knavery; taking away our goods without making any return. But the instances of this were rare, and we had abundant reason to approve the integrity of their conduct. However, their eagerness to possess iron, brass, or any kind of metal, was so great, that when an opportunity presented itself, few of them could resist the temptation to steal it. The inhabitants of the South-sea islands in their petty larcenies were actuated by a childish disposition, rather than a thievish one. The novelty of the object excited their curiosity, and was a sufficient inducement for them to get possession of it by any means: but the natives of Nootka, who made free with our property, are entitled to no such apology. The appellation of thieves is certainly applicable to them; for they well knew that what they pilfered from us would be subservient to the private purposes of utility; and it was fortunate for us, that metals were the only articles upon which they set any value; but these are very common among themselves, producing continually quarrels, of which we saw several instances.

The two villages we visited are probably the only inhabited parts of the sound. The number of inhabitants may be computed from the canoes that visited our ships the second day after our arrival. They consisted of about a hundred, which upon an average, contained, at least, five persons each; but as there were very few women, children, or young men among them, we may reasonably suppose, that the number of souls in the two villages, could not be less than four times the number of our visitors, being in the whole two thousand. The village, situated at the entrance of the sound, stands on the side of a pretty steep ascent, extending from the beach to the wood. There are holes, or windows, in the sides of the houses to look out at, having bits of mats hung before them, to prevent the rain getting in. Their houses, in the inside may, with propriety, be compared to a long English stable with a double range of stalls, and a board passage in the middle; for the different families are separated only by a piece of plank. Close to the sides, in each of these parts, is a bench of boards, raised five or six feet higher than the rest of the floor, and covered with mats, whereon the family sit and sleep. These benches are commonly seven or eight feet long, and four or five broad. In the middle of the floor, between them, is the fire-place, which has neither hearth nor chimney. This part appeared common to them all. The nastiness and stench of their houses are at least equal to the confusion within; for, as they dry their fish within doors, they also gut them there, which, with their bones and fragments, thrown down at meals, and the addition of other sorts of filth, lie every where in heaps, and are, it should seem, never carried away, till they become troublesome, from their size, to walk over them. In a word, their houses are as filthy as hog-sties; every thing in, and about them, stinking of fish, train oil and smoke. Their furniture consists chiefly of chests and boxes of various sizes, piled upon each other, at the sides or ends of each house, wherein they deposit all their valuables, such as skins, garments, masks, &c. Many of these boxes are painted black, and studded with the teeth of animals, or rudely decorated with figures of birds carved. To complete the scene of confusion, in different parts of their habitations are hung up implements of fishing, and other articles. Among these we may reckon their images, which are nothing more than the trunks of large trees, of the height of about four feet, placed at the upper end of the apartment, with a human face carved on the front, and the hands and arms upon the sides. These figures are variously painted, and make, upon the whole, a ridiculous appearance. They are called generally Klumma. A sort of curtain, made of mat, usually hung before the images, which the natives were sometimes unwilling to remove; and when they did consent to unveil them, they seemed to express themselves in a very mysterious manner; and yet

An Indian Harbour with a representation of the Natives & their Habitations

yet they were held in no very extraordinary degree of estimation, seeing, with a small quantity of brass or iron, all the idols in the place might have been purchased. Mr. Webber, when drawing a view of the inside of a house, wherein those figures were placed, was interrupted in his work by one of the inhabitants. Mr. Webber, thinking a bribe would have a proper effect, presented to him a metal-button from his coat, which immediately operated as was intended: soon after he was again interrupted by the same man, who held a mat before the figures: our gentleman therefore gave him another button, and was again suffered to proceed. The man then renewed his former tricks, till Mr. Webber had parted with every single button; after which he received not any farther molestation.

As to the domestic life of these people, the men seem to be chiefly employed in fishing and killing animals, for the sustenance of their families, few of them being engaged in any household business; but the women were employed in manufacturing their garments; and in curing sardines, which they also carry from the canoes to their houses. They also go in small canoes, to gather mussels, and other shell-fish. In the labour of the paddle they are as dextrous as the men, who shew them very little respect or attention on this, or any other occasion. But the young men are remarkably indolent, sitting generally about in scattered companies, basking in the sun, or wallowing in the sand upon the beach, like so many hogs, without any kind of covering. This disregard of decency was, however, confined solely to the males; for the females were always clothed, and behaved with great propriety, meriting justly commendation for a modest bashfulness, so becoming that sex. In the women of this place, it is the more meritorious, as the men have not the least sense of shame. Both sexes pass much of their time in their canoes, especially in the summer; in which they eat, sleep, and frequently lie to bask themselves in the sun; for these purposes they are sufficiently spacious, and are, in rainy weather, more comfortable habitations than their filthy houses.

Though their food, strictly speaking, may be said to consist of every thing animal or vegetable that they can procure, yet the quantity of the latter bears an exceeding small proportion to that of the former. Their greatest reliance for food is upon the sea, as affording fish, mussels, smaller shell-fish, and sea-animals. Among the first are herrings, sardines, two species of bream, and some small cod. The herrings and sardines not only serve to be eaten fresh in their season, but to be dried and smoked as stores. The roes of these also, strewed upon the branches of the Canadian pine, or prepared upon a long sea grass, afford them another grand resource for food. They also eat the roe of some other large fish, that has a very rancid smell and taste. The large mussels are found in great abundance in the sound. After having roasted them in their shells, they are stuck upon long wooden skewers, and taken off as they are wanted to be eaten. They require no other preparation, though they are sometimes dipped in oil, as sauce. The porpoise is a food more common among them, than that of any other animal in their sea; the flesh and rind of which they cut into large pieces, dry them as they do herrings, and eat them without farther preparation. They also make a sort of broth from the porpoise, when fresh, in a very singular manner. They put some pieces of it into a wooden vessel, containing a sufficient quantity of water, into which they throw heated stones. This operation is repeated till the contents are supposed to be stewed enough. This is a common dish among them, and seems to be a strong nourishing food. They likewise feed probably upon whales, seals, and sea-otters, the skins of the two latter being common among them, and they are furnished with implements of all sorts for their destruction, though perhaps they may not be able, at all seasons, to catch them in great plenty. However, from these, and other sea-animals, they procure oil in great abundance, which they use, mixed with other food, as sauce; and often sip it alone with a kind of horn-scoop. Their

No. 66.

fresh skins, at this time, were very scarce; as were the land animals; for we saw no flesh belonging to the latter; and, though their skins were to be had in plenty, they might, perhaps, have been procured from other tribes. From these, and other circumstances, it plainly appeared to us, that these people are furnished with the principal part of their animal food by the sea; if we except a few gulls, and some other birds, which they shoot with their arrows. Their only winter vegetables seem to be the Canadian pine-branches, and sea-grass; but, as the spring advances, they use others as they come in season. The most common of these were two sorts of roots, of a mild sweetish taste, which are eaten raw; as is also a small, sweetish root, about the thickness of farfaparilla. As the season advances, they have doubtless many others which we did not see: for, though there is not the least appearance of cultivation among them, there are plenty of elder, gooseberry, and currant bushes. One of the conditions, however, which they seem to require in all their food, is, that it should be of the less acrid kind; for they would not touch the leak or garlic, though they sold us great quantities of it, when they understood it was what we liked. They seemed not to relish any of our food, and rejected our spirituous liquors as disgusting and unnatural. It is their ordinary practice to roast or broil their food; for they are absolute strangers to our method of boiling, as appears from their manner of preparing porpoise broth; besides, as they have only wooden vessels, it is impossible for them to perform such an operation. Their manner of eating corresponds with the nastiness of their houses and persons; for the platters and troughs, out of which they eat their victuals, seem never to have been washed since their original formation; the dirty remains of a former meal, being only swept away by a succeeding one. Every thing solid and tough, they tear to pieces with their hands and teeth; for though their knives are employed in cutting off the larger portions, they have not yet endeavoured to reduce these to mouthfuls by the same means, though more cleanly and convenient. But they do not possess even an idea of cleanliness, and eat constantly the roots which are dug out of the ground, without attempting to shake off the soil that adheres to them. Whether they have any set time for their meals we never could find out, having seen them eat at all hours in their canoes. But having observed several messes of porpoise broth preparing about noon, when we went to the village, they may probably make a principal meal about that time.

These people have bows, and arrows, spears, slings, short truncheons made of bone, and a small pick-axe, somewhat resembling the common American tomahawk. Some of the arrows are pointed with iron, and others with indented bone: the spear has usually a long point made of bone. The tomahawk is a stone of the length of seven or eight inches, one end terminating in a point, and the other fixed in a wooden handle. This is intended to resemble the head and neck of a human figure; the stone being fixed in the mouth so as to represent a tongue of a great magnitude. To heighten the resemblance, human hair is also fixed to it. This weapon is called *taaweeh*; and they have another made of stone, which they call *secaik*, about ten or twelve inches long, having a square point. From the number of their weapons it may be reasonably concluded, that they engage frequently in close combat; and we had very disagreeable proofs of their wars being both frequent and bloody, from the quantity of human skulls that were offered to us for sale.

With respect to the design and execution of their manufactures, and mechanic arts, they are more extensive and ingenious than could possibly be expected from the natural disposition of the people, and the little progress they have made in civilization. The flaxen and woollen garments engage their first care, as being the most material of those that may be classed under the head of manufactures. The former are fabricated from the bark of the pine-tree, beat into a mass resembling hemp. After having been prepared in a proper manner, it is spread upon a stick, fastened to two

others in an erect position. The manufacturer, who sits on her hams at this simple machine, knots it across, at the distance of about half an inch from each other, with small plaited threads. Though it cannot, by this method, be rendered so close and firm as cloth that is woven, it is sufficiently impervious to the air, and is likewise softer and more pliable. Their woollen garments have much the appearance of woven cloth; but the supposition of their being wrought in a loom is destroyed, by the various figures that are ingeniously inserted in them; it being very improbable that these people should be able to produce such a complex work, except immediately by their hands. They are of different qualities; some resembling our coarsest sort of blankets; and others not much inferior to our finest sort, and certainly both softer and warmer. The wool of which they are manufactured, seems to be procured from different animals, particularly the fox and brown lynx. That from the lynx is the finest, and nearly resembles our coarsest wools in colour; but the hair, which also grows upon the animal, being intermixed with it, causes the appearance to be somewhat different when wrought. The ornamental figures in these garments are disposed with great taste, and are generally of a different colour, being usually dyed either of a deep brown, or a yellow; the latter of which, when new, equals in brightness, the most vivid in our best carpets.

Their taste for carving on all their wooden articles, corresponds with that of working figures upon their garments. Nothing is to be seen without a kind of freeze-work, or a representation of some animal upon it; but the most common one is that of the human face. The general design of these figures conveys a sufficient knowledge of the objects they are intended to represent; and in the execution of many of the masks and heads, they prove themselves to be ingenious sculptors. They preserve, with the greatest exactness, the general character of their own faces, and finish the more minute parts with great accuracy and neatness. That these people have a fondness for works of this sort is observable in a variety of particulars. Representations of human figures, birds, beasts, fish, and models of household utensils, were found among them in a very great abundance. To their skill in the imitative arts, we may add their drawing them in colours. The whole process of their whale-fishery has been represented, in this manner, on the caps they wear. The execution was indeed rude, but hereby we were convinced, that, though they have not the knowledge of letters among them, they have a notion of representing actions in a lasting way, exclusive of recording them in their songs and traditions.

The structure of their canoes is simple, yet they are well calculated for every useful purpose. The largest sort, which in each one will contain upwards of twenty people, are formed of a single tree. The length of many of them is 40 feet, the breadth 7, and the depth 3. They become gradually narrower from the middle towards the end, the stern ending, perpendicularly, with a knob at the top. The fore-part stretches forwards, and upwards, and ends in a point, or prow, much higher than the sides of the canoe, which are nearly straight. The greatest part of them are without any ornament; but some have a little carving, and are studded with seals teeth on the surface. They have neither seats, nor any other supporters, on the inside, except some small round sticks, about the size of a walking cane, placed across, about half the depth of a canoe. They are very light, and, on account of their breadth and flatness, swim firmly, without an out-rigger, of which they are all destitute. Their paddles, which are small and light, resemble a small leaf in shape, being pointed at the bottom, broad in the middle, and gradually becoming narrower in the shaft; the whole length being above five feet. By constant practice, they have acquired great dexterity in the management of these paddles; but they never make use of any sails.

In their employment of fishing and hunting, their instruments are ingeniously contrived, and completely made. They consist of nets, hooks, lines, harpoons,

gigs, and an instrument resembling an oar. The last is about 20 feet in length, four or five inches in breadth, and of the thickness of half an inch. The edges for about two thirds of its length, are set with sharp bone-teeth; the other third serving for a handle. With this instrument they strike herrings, sardines, and other fish as come in shoals, which are taken either upon or in the teeth. Their hooks, made of bone and wood, display no great ingenuity; but the harpoon, used in striking whales, and other sea animals, manifests evident contrivance. It consists of a piece of bone, formed into barbs, in which the oval blade of a large muscle shell, and the point of the instrument are fixed. Two or three fathoms of rope is fastened; to one end of which the harpoon is fixed so as to leave the shaft floating, as a buoy upon the water, when the animal is struck.

As to their manner of catching land animals, or killing them, we are strangers; but, it is probable that they shoot the smaller sorts with their arrows, and encounter bears, wolves, and foxes, with their spears. Sometimes they decoy them, by covering themselves with their skins, and running upon all fours, at which sport they are remarkable nimble. For the same purposes the masks, or carved heads, as well as the dried heads of different animals, are used.

Every particular of the rope kind, which they use in making their various articles, is formed either from thongs of skins, and sinews of animals, or from the flaxen substance, of which they manufacture their mantles. The sinews were sometimes so remarkably long, that it was hardly possible they could have belonged to any other animal than the whale. The assistance they receive from iron tools contributes to their dexterity in wooden performances. Their implements are almost wholly made of iron. One chissel indeed we saw made of bone. This consists of a flat long piece, fastened into a wooden handle. A stone is their mallet, and a bit of fish-skin their polisher. Some of these chissels were nine or ten inches in length, and three or four in breadth; but they were, in general, considerably smaller. The chissel and the knife are the principal forms that iron assumes among them. Some of their knives are very large, having crooked blades; the edge being on the back, or convex part. They are sharpened upon a coarse slate whetstone, and kept continually bright. What we saw among them, were about the breadth and thickness of an iron hoop; and their singular form plainly proves, that they are not of European make. Iron is called by the natives seekemaile, a name which they also give to tin, and other white metals. It being so common among these people, we were anxious to discover how it could be conveyed to them. On our arrival in the sound, we perceived that they had a knowledge of traffic, and an inclination to pursue it; and we were afterwards convinced, that they had not acquired this knowledge from a cursory interview with strangers; but with whom they carried on this traffic we could not learn; for though we saw several articles of European manufacture, such as brass and iron, yet it does not follow, that they were received from European nations. We could not obtain the least information of their having seen ships, like ours, before, nor of their having been engaged in commerce with such civilized people. Many circumstances corroborate to prove this beyond doubt. On our arrival, they were earnest in their enquiries, whether we meant to settle among them, and whether we were friendly visitors, informing us, at the same time, that they gave us wood and water from motives of friendship. This proves sufficiently, that they considered themselves as proprietors of the place, and dreaded no superiority: for it would have been an unnatural enquiry, if any ships had been here before, and had supplied themselves with wood and water, and then departed; for they might then reasonably expect that we should do the same. It must be admitted, indeed, that they exhibited no marks of surprise at beholding our ships; but this may, with great propriety, be attributed to their natural indolence of temper, and their wanting a thirst of curiosity. They were

were never startled at the report of a musquet, till they, one day, shewed us that their hide dresses were impene- trable to their spears and arrows, when one of our peo- ple shot a musquet ball through one of them that had been six times folded. Their astonishment at this plainly indicated their ignorance of the effect of fire arms. This was afterwards very frequently confirmed, when we used to shoot birds, at which they appeared greatly confounded. Our explanation of the piece, to- gether with the nature of its operation, with the aid of shot and ball, struck them so forcibly, as to convince us of their having no previous ideas on this matter. Though some account of a voyage to this coast, by the Spaniards, in 1774, or 1775, had arrived in England before we sailed, the circumstances just mentioned, prove, that these ships had never been at Nootka. It is also evident, that iron could not have been in so many hands, nor would the use of it have been so well known, if they had so lately obtained the first knowledge of it. From their general use of this metal, it probably comes from some constant source, in the way of traffic, and they have perhaps been long supplied with it; for they use their tools with as much dexterity as the longest practice can acquire. The most natural conjecture, therefore, is, that they trade for their iron with other Indian tribes, who may have some communication with European settlements upon that continent, or receive it through several intermediate nations. By the same means they probably obtain their brass and copper. Not only the rude materials, but some manufactured articles seem to have found their way hither. The brass ornaments for noses are made in so masterly a manner, that the Indians cannot be supposed capable of fabricating them. We are certain, that the materials are European, as all the American tribes are ignorant of the method of making brass; but copper has been frequently met with, and, from its ductility, might be easily fashioned into any shape, and polished. If such articles are not used by our traders to Hudson's Bay and Canada, in their traffic with the natives, they must have been introduced at Nootka from Mexico; whence, it is probable, the two silver table spoons were originally derived.

With respect to the religious and political institutions established among these people, we cannot be supposed to have acquired much knowledge. However, we discovered, that there were such men as chiefs, distinguished by the title of *Acweek*, to whom the others are, in some degree, subordinate. But the authority of each of these great men, seems to extend no farther than to his own family, who acknowledge him as their head. Nothing that we saw could give us an insight into their notions of religion, except the figures already mentioned, called *kiumma*. These, perhaps, were idols; but as the word *acweek* was frequently mentioned when they spoke of them, we suppose they may be the images of some of their ancestors, whose memories they venerate. This however is all conjecture; for we could receive no information concerning them, as we knew little more of their language than to enable us to ask the names of things, and being incapable of holding any conversation with the natives relative to their traditions, or their religious institutions. The word *wakash* was frequently in their mouths. It seemed to express approbation, applause and friendship. Whenever they appeared to be pleased or satisfied, they would call out *wakash! wakash!* It is worthy of remark, that as these people differ from the natives of the islands in the Pacific Ocean, in their persons, customs, and language, we cannot suppose their respective progenitors to have belonged to the same tribe, when they emigrated into those places where we now find their descendents.

Their language is, by no means, harsh or disagree- able, farther than their pronouncing the *k* and *h* with a stronger aspiration, or more force than we do. They have one sound, which is very frequent, and not used by us. It is formed in a particular manner by clashing the tongue partly against the roof of the mouth. It is difficult to represent this sound by any composition of our letters, unless from *lshthl*; which is generally used as a termination. The next is composed of *tl*; and

many words end with *z* and *fs*. A specimen or two of each of these is here put down.

Opulshthl	- -	The Sun
Onulshthl	- -	The Moon
Kahsheetl	- -	Dead
Teehsheetl	- -	To throw a stone
Koomitz	- -	A human skull

With respect to the composition of their language we can say very little, having been scarcely able to distinguish the several parts of speech. We can only infer from their manner of speaking, which is very slow and distinct, that it has very few prepositions or conjunctions; and, as far as we could discover, is destitute of even a single interjection, to express admiration or surprize. From having few conjunctions, it may be conceived, that each single word, with them, will comprehend a great number of single ideas; which seems to be the case; but, for the same reason, the language will be defective in other respects, not having words to distinguish or express differences which really exist; and hence not sufficiently copious. This was observed to be the case, in many instances, particularly with respect to the names of animals. The relation or affinity it may bear to other languages, either on this, or the Asiatic continent, we have not been able sufficiently to trace, for want of proper specimens to compare it with, except those of the Esquimaux, and Indians about Hudson's Bay; to neither of which it has the least resemblance. On the other hand, from the few Mexican words we have been able to procure, there is the most obvious agreement in the terminations of words.

In Nootka Sound it is high water, in the days of the new and full moon, at twenty minutes after twelve: the perpendicular rise and fall being eight feet, nine inches; which is to be understood of the day tides, and those which happen two or three days after the full and new moon. The night tides, at this time, rise near two feet higher. Some circumstances that occurred daily, relating to this, deserve particular notice. In the cove where we got wood and water, was a great deal of drift-wood cast ashore, a part of which we had to remove, to come at the water. Now it frequently happened, that large pieces of trees, that we had removed in day, out of the reach of the then high water, were found by us floated again in our way the next morning; and all our spouts for conveying water, thrown out of their places, which were immoveable during the day-tides. We found likewise wood, which we had split up for fuel, and had placed beyond the reach of the day-tide, floated away during the night. Some of these circum- stances occurred every night and morning, for three or four days in the height of the spring tides. To render our account of the transactions in Nootka Sound com- plete we must add, that by a variety of astronomical and nautical observations, we found its latitude to be 49 deg. 36 min. 6 sec. North, and its longitude 233 deg. 17 min. 14 sec. East.

It has been already related, that we put to sea on the 26th of April, in the evening, with manifest indica- tions of an approaching storm; and by these signs we were not deceived, for we had scarce sailed out of the Sound, when the wind shifted from N. E. to S. E. by E. and blew a strong gale, with squalls and rain, the sky being, at the same time, uncommonly black. Ap- prehensive of the wind's veering more to the South, which would expose us to the danger of a lee-shore, we

got the racks on board, and made all the sail we could to the S. W. It fortunately happened, that the wind veered no farther towards the S. and S. E. so that early the next morning we were entirely clear of the coast. The Discovery being at some distance astern, we brought to till she came up, and then both vessels steered a north-westerly course. Between one and two o'clock P. M. there was a perfect hurricane, inasmuch that our commodore thought it exceeding dangerous to run any longer before it; we therefore, agreeable to his order, brought the ships to, with their heads to the south. In this situation our ship, the Resolution, sprung a leak in her starboard quarter, which at first alarmed us greatly; but after the water was baled out, which kept us employed till midnight, we kept it under by means of the pump. In the evening, the wind having shifted to the southward, its fury in some measure abated; upon which we stretched to the west: but about eleven, the gale again increased, and continued till five the next morning, when the storm seemed to have spent its force, and became moderate. The weather now

clearing up, we were able to see several leagues around us, and steered more to the north. At noon we steered N. W. by N. with a fresh gale and fair weather. But, towards the evening, the wind again blew hard, with squalls and rain. With this weather we continued the same course till the 30th, when we steered N. by W. intending to make the land. Captain Cook regretted that we could not do it sooner, as we were now passing the spot where the pretended strait of Admiral de Fonte has been placed by geographers. Though the captain gave no credit to such vague and improbable stories, he was desirous of keeping the coast of America aboard, that this point might be cleared up beyond dispute: but, at the same time, he considered, that it would have been very imprudent to have engaged with the land while the weather was so tempestuous, or to have lost the advantage of a fair wind, by waiting for less stormy weather. This day, at noon, by observation, we found our latitude to be 53 deg. 22 min. north, and our longitude 225 deg. 14 min. east.

ON Friday the 1st of May, not seeing land, we steered to the N. E. having a fresh breeze at S. S. E. attended with squalls, showers of hail and rain. About seven o'clock, P. M. we descried land, distant twelve leagues. At four o'clock the next morning the coast was seen from S. E. to N. by W. the nearest part distant five leagues. At the same time, the northern point of an inlet, or at least what appeared to be one, bore E. by S. from whence to the northward, along the coast, there seemed to be many bays and harbours. At six, approaching nearer to the land, we pursued the direction of it, steering N. W. by N. and between eleven and twelve we passed a cluster of small isles, situated near the continent, to the northward of the southern point of an extensive bay. An arm of this bay seemed to reach towards the north, behind a round lofty mountain, that stands between it and the sea. To this eminence Captain Cook gave the name of Mount Edgecumbe; and the point of land projecting from it, was called Cape Edgecumbe. The Cape lies in latitude 57 deg. 3 min. N. and in long. 224 deg. E. The land, except what is contiguous to the sea, is of considerable height, abounding with hills. Mount Edgecumbe, which far out-tops all the rest, was entirely covered with snow, as were also the other elevated hills; but the lower ones, and the spots rising near the sea, were covered with wood. Pursuing our course to the northward, we found the coast to trend to the N. and N. E. for six or seven leagues, and there formed a spacious bay. Some island being in the entrance of it, we gave it the name of the Bay of Islands.

On Sunday the third, at half an hour past four, P. M. Mount Edgecumbe bore south 54 deg. E. a large inlet, N. 50 deg. E. and the most advanced point of land towards the N. W. lying under a very lofty mountain, which was called Mount Fair-Weather, bore N. 32 deg. west. The inlet was named Cross Sound, it being first observed on the day so marked in our calendar. An eastern promontory forms the south-eastern point of this Sound; this we distinguished by the name of Cross-Cape. Under the above-mentioned peaked mountain is a point, which was named Cape Fair-Weather. At noon, this cape was distant thirteen leagues. Having

for several days light breezes, we steered S. W. and W. S. W. till the morning of the fourth, when we tacked, and stood towards the shore. At noon Mount Fair-Weather bore north, 63 deg. E. This mount is the highest of a chain or ridge of mountains, that rise at the north-western entrance of Cross Sound, and extend towards the N. W. parallel with the coast. They are covered with snow, from the highest summit down to the sea-coast, except in a few places, where we could discern trees that seemed to rise, as it were from the sea. About five o'clock, P. M. the top of a high mountain appeared above the horizon, bearing N. 26 deg. W. forty leagues distant. This we supposed to be the mount Elias of Commodore Beering. In the course of the day we observed a brownish duck, with a dark indigo head and neck; likewise several whales, porpoises, seals, &c. Having light winds, with occasional calms, we made but little way. On Wednesday the 6th, the nearest land being distant eight leagues, we perceived, in a north-easterly direction, the appearance of a bay, and an island, by its southern point, covered with wood. This is probably the place where Beering anchored: Captain Cook, therefore, in honour of the first discoverer, named it Beering's bay; southward of which the ridge of mountains is interrupted by a plain of several leagues in extent, beyond which the sight was unbounded. On the seventh, at noon, we were five leagues from the shore; from which station we observed a bay under the high land, with low woodland on each side of it. We now perceived, that the coast trended considerably to the west. On the ninth, at noon, Mount Elias bore N. 30 deg. E. distant 19 leagues. This stands twelve leagues inland, lat. 60 deg. 27 min. N. long. 219 deg. E.

Sunday, the 10th, we observed in lat. 59 deg. 51 min. and in long. 215 deg. 56 min. being only three leagues distant from the coast of the continent, which extended from E. half N. to N. W. half W. as far as the eye could reach. To the westward of the latter direction we saw an island, distant six leagues. A point, which the Commodore named Cape Suckling, projects towards the north-eastern end of the island: Within this cape stands a hill of considerable height, divided from

from the second range of mountains by low land; so that the cape, at a distance, has the appearance of an island. A bay is seated on the north side of Cape Suckling, seemingly extensive, and sheltered from most winds. Before night, we had approached near enough the cape to see some low land projecting from it to the N. W. we also observed some small islands in the bay, and several elevated rocks between the cape and the north-eastern extremity of the island. Early the next morning the wind shifted from N. E. to N. which being against us, the Commodore relinquished his design of going into the bay, and bore up for the west end of the island. Having a calm about ten o'clock, we embarked in a boat, and landed on the island, with a view of seeing what lay on the other side; but finding the hills to be at a greater distance than was expected, we laid aside that intention. On a small eminence near the shore, the captain left, at the foot of a tree, a bottle containing a paper, on which the names of our ships, and the date of our discovery were described: he inclosed also two silver twopenny pieces of English coin, which, with many others, had been furnished him by Dr. Kaye, now dean of Lincoln; and in testimony of his esteem for that gentleman, Captain Cook called the island Kaye's Island. It does not exceed 36 miles in length, and its breadth is not above four miles in any part. The S. W. point is a naked rock, elevated considerably. Its lat. is 59 deg. 49 min. north, long. 216 deg. 58 min. east. Towards the sea, the island terminates in bare sloping cliffs, with a beach consisting of large pebbles, intermixed in some places with a clayey sand. Some parts of the shore are interrupted by small valleys and gullies, in each of which a rivulet or torrent rushes down with a considerable degree of impetuosity; lasting perhaps no longer than the whole of the snow is dissolved. The valleys are filled with pine-trees; and these, indeed, abound in other parts of the island, which is covered as it were with a broad girdle of wood. The trees, however, are far from being of an extraordinary growth: on which account, they would be of no great service for shipping, except as materials for making top-gallant-masts, and other small things. Neither Canadian, nor Cypress pines, are to be seen among them, but we saw some currant, and hawberry bushes, a yellow flowered violet, and the leaves of other plants not yet in flower. A crow was seen flying about the wood: two or three white-headed eagles, like those of Nootka, were also observed; besides another species, equally large, which has a white breast. In our passage from the ship to the shore, we saw a number of fowls sitting on the water, or flying about; the principal of which were gulls, burres, shags, ducks, or large petrels, divers, and quebrantahueses. There was also a single bird flying about, apparently of the gull kind, whose colour was a snowy white, with some black along part of the upper sides of its wings. We saw one fox near a wood; also two or three small seals were seen on the shore; but not any traces of inhabitants could be found.

In the afternoon Captain Cook, with those who accompanied him, returned on board; after which we set sail, and, with a light breeze from the east, we steered for the south-west side of the island, which we got round by eight o'clock in the evening; we stood for the westernmost land, now in sight. At the north-east end of Kaye's Island stands another, extending N. W. and S. E. about nine miles, to within the same distance of the north-western boundary, to which the name of Comptroller's Bay was given. The next morning, being Tuesday the 12th, Kaye's Island was still in sight, bearing E. by S. At noon, when in lat. 61 deg. 17 min. the eastern point of a spacious inlet bore west-north-west, three leagues distant. From Comptroller's Bay to this point, which the Commodore named Cape Hinchinbrook, the direction of the coast is nearly E. and W. Beyond this it appeared to incline towards the south; a direction very different from that marked out in the modern charts, founded on the late discoveries of the Russians; inasmuch, that we had some reason to expect, that we should find, through the inlet before us, a passage to the N. and that the land to

No. 67.

the W. and S. W. was a group of islands. We had no sooner reached the inlet, than the weather became exceedingly foggy; it was therefore thought necessary that the ships should be secured during the continuance of the fog. With this view we hauled close under Cape Hinchinbrook, and cast anchor in eight fathoms water, at the distance of about two furlongs from the shore. Soon after the boats were hoisted out, some to fish, and others to found. At intervals, the fog cleared away, and gave us a prospect of the neighbouring land. The cape was one league distant; the western point of the inlet five leagues; and the land on that side extended to W. by N. Between this point and N. W. by W. we could discern no land. The most westerly point we had in view on the north shore, was at the distance of two leagues. Betwixt this point, and the shore under which our ships now lay at anchor, is a bay about three leagues deep, on the south-eastern side of which are several coves; and in the middle are placed some rocky islands. To these Mr. Gore was dispatched in a boat, in order to shoot some birds. He had scarcely reached them, when about twenty natives appeared in two large canoes; upon which he returned to the ship, and they followed him. They were unwilling, however, to venture along-side, but kept at a little distance, shouting aloud, and clapping and extending their arms alternately. They then began a song, much after the manner of King George's, or Nootka Sound. Their heads were strewed with feathers, and one of them held out a white garment, which we supposed was intended as a token of friendship; while another, for near a quarter of an hour, stood up in the canoe, entirely naked, with his arms extended like a cross, and motionless. Their canoes were constructed upon a different plan from those of Nootka. The frame consisted of different laths, and the outside was formed of the skins of seals, or other animals of a similar kind. Though some of our people repeated the most common words of the language of Nootka, they did not appear to understand them. After they had received some presents that were thrown to them, they retired towards the shore, intimating by signs, that they would pay us another visit the next morning. Two of them came off to us in the night, each in a small canoe, hoping, perhaps, they might have an opportunity of pilfering; for they went away as soon as they perceived themselves discovered. The wind, during the night, blew hard in squalls, with rain, and thick hazy weather.

On Wednesday the 13th, at ten o'clock, A. M. the wind becoming more moderate, we got up our anchors, and made sail, in order to search for some convenient place where we might stop the leak, as our present situation was too much exposed for that purpose. We at first intended to have gone up the bay before which our ships had anchored; but, by the clearness of the weather, we were afterwards induced to steer towards the north, further up the great inlet. Having passed the N. W. point of the above-mentioned bay, we found that the coast, on that side, inclined to the eastward: we did not follow it, but proceeded on our course to the northward, for a point of land which we observed in that direction. In the afternoon, before two o'clock, the foul weather returned, with so thick a fog, that we could discern no other land but the point just mentioned, off which we arrived between four and five o'clock, and found it to be a little island, situate at the distance of about two miles from the neighbouring coast, being a point of land on the eastern side of which we discovered an excellent bay, or rather harbour: to this we plied up, while the wind blew in very hard squalls, accompanied with rain. In passing the island, we found a muddy bottom, at the depth of twenty-six fathoms. At length, about eight o'clock, we were obliged, by the violence of the squalls, to cast anchor in thirteen fathoms water, before we had proceeded so far into the bay as the Commodore intended; but we thought ourselves fortunate enough in having the ships already secured, for the night was exceeding tempestuous. But, notwithstanding the weather was so turbulent, the natives were not deterred from paying us a visit. Three of

6 Y

them

them came off in two canoes: two of them in one, and one in the other, being the number that each canoe could carry; for they were constructed nearly in the same manner with those of the Esquimaux, except that in one of them were two holes for two persons to sit in, and in the other but one. The men had each a stick, about three feet long, with the large feathers, or wings of birds, fastened to it, which they probably held up to us as tokens of peace. The treatment these three received, induced many others to visit us, between one and two o'clock the following morning, in both great and small canoes. Some of them ventured on board the *Resolution*, though not before some of our people had stepped into their boats. Among those who came on board, was a middle-aged man, who, as we afterwards found, was a chief. His dress was made of the skin of the sea-otter, and he had on his head such a cap as is worn by the inhabitants of Nootka, embellished with sky-blue glass beads. Any kind of beads seemed to be in high estimation among these people, who readily gave in exchange for them whatever they had, even their fine sea-otter skins. They coveted particularly iron, but absolutely rejected small bits, and required pieces nine or ten inches long at least, and three or four fingers broad. But they obtained little of this commodity from us, as by this time it was become rather scarce. The points of some of their spears were of this metal; others were of copper, and a few were bone; of which last the points of their arrows, darts, &c. were formed. The chief could not be prevailed upon to venture below the upper deck, nor did he and his companions continue long aboard. While they staid with us, it was necessary to watch them narrowly, as they soon manifested an inclination for thieving. At length, when they had been three or four hours alongside the *Resolution*, they all quitted her, and repaired to the *Discovery*, which ship none of them had before been aboard of, except one man, who came from her at this very time, and immediately returned to her, in company with the others. As soon as they had departed from our ship, Captain Cook dispatched a boat to sound the head of the bay; for, as the wind was moderate at present, it was intended to lay the ship ashore, if a proper place could be found for the purpose of stopping the leak. Soon afterwards all the Americans quitted the *Discovery*, and made their way towards our boat that was employed in sounding. The officer who was in her, observing their approach, returned to the ship, and all the canoes followed him. The crew of the boat had no sooner repaired on board, leaving in her by way of guard two of their numbers, than several of the natives stepped into her, some of whom presented their spears before the two men, while others loosed the rope by which she was fastened to the ship, and the rest were so daring as to attempt to tow her away; but the moment they saw we were preparing to oppose them, they let her go, stepped into their own boats, and made signs, in order to persuade us to lay down our arms, being to all appearance perfectly unconcerned. This attempt, though a very bold one, was scarce equal to what they had meditated on board Captain Clerke's ship. The man, whom we mentioned before as having conducted his countrymen from the *Resolution* to the *Discovery*, had first been aboard of the latter; where, looking down all the hatchways, and observing no one, except the officer of the watch, and two or three more, he doubtless imagined that he might be plundered with ease, particularly as she was stationed at some distance from the *Resolution*. It was unquestionably with this intent, that the natives went off to her. Several of them repaired aboard without the least ceremony, and drawing their knives, made signs to the officer to keep off, and began to search for plunder. The first thing they laid their hands on was the rudder of one of our boats, which they immediately threw overboard to those of their party, who continued in the canoes. But before they could find another object that struck their fancy, the ship's crew were alarmed, and many of them, armed with cutlasses, came upon deck. The plunderers no sooner saw this, than they all sneaked off into their canoes, with evident

marks of indifference. It was at this time that our boat was employed in sounding, as we have already mentioned; and the natives, without delay, proceeded towards her, after the disappointment they had met with at the *Discovery*. Their visiting us so early in the morning was undoubtedly with a view of plundering, on a supposition that they should find all our people asleep. We were now on the point of weighing anchor, in order to proceed further up the bay, when the wind began to blow as violently as before, and was attended with rain, inasmuch that we were obliged to bear away the cable again, and lie fast. In the evening, perceiving the gale of wind did not abate, and thinking it might be some time before an opportunity of getting higher up presented itself, the Commodore was determined to head the ship in our present station; and, with that view, caused her to be moored with a kedge anchor and hawser. One of the sailors, in heaving the anchor out of the boat, was carried over-board by the buoy-rope, and accompanied the anchor to the bottom. In this hazardous situation he had presence of mind sufficient to disengage himself, and came up to the surface of the water, where he was immediately taken up, with a dangerous fracture in one of his legs.

On Friday the 15th, at day-break, we gave our ship a good heel to port, in order to stop the leak, which, on ripping off the sheathing, was found to be in the seams. While the carpenters were employed in this business, others of our people filled the water-casks at a stream not far from our station. On the 16th, towards the evening, the weather cleared up, and we then found ourselves encompassed with land. Our station was on the eastern side of the sound, in a place distinguished by the appellation of Snug-corner Bay. The Captain, accompanied by some of his officers, went to take a survey of the head of it, and they found it to be sheltered from all winds, having a muddy bottom at the depth of seven to three fathoms. The land near the shore is low, partly wooded, and partly clear: the clear ground was covered with snow, but very little remained in the woods. The summits of the hills, in the neighbourhood, were covered with wood; but those that were at a greater distance inland had the appearance of naked rocks, covered with snow. Our leak being at length stopped, on the 17th, at four o'clock, A. M. we weighed anchor, and steered a N. W. course, with a gentle breeze at E. N. E. Soon after we had made sail, the Americans visited us again. When we had reached the north-western point of the arm wherein we had anchored, we observed that the flood tide came into the inlet, by the same channel through which we had entered. This circumstance did not much contribute to the probability of a passage to the north through the inlet, though it did not make entirely against it. Having past the point just mentioned, we met with much foul ground, and many sunken rocks: the wind failed us, so that we had some difficulty in extricating ourselves from the danger with which we were threatened; however, about two o'clock P. M. we cast anchor under the eastern shore, in 13 fathoms, and four leagues distant from our last station. The weather soon after cleared up, and we had a distinct view of all the surrounding land, particularly towards the north, where it appeared to close. This gave us but little hope of meeting with a passage that way; but, in order to form a right judgment, Lieutenant Gore was sent out with two armed boats to examine the northern arm; and, at the same time, the master was dispatched with two other boats, to survey another arm that seemed to incline towards the east. Both returned at night. By the Master we were informed, that the arm, to which he had been sent, communicated with that we had last quitted, and that one side of it was formed by a cluster of islands. Mr. Gore reported, "that he had seen the entrance of an arm, which, he was of opinion, extended a long way to the N. E. and that probably by it a passage might be found." On the other hand, Mr. Roberts, one of the mates, who had been sent with Mr. Gore to sketch out the parts they had examined, was of opinion that they saw the head of this arm. "The disagreement of these two opinions (observes Captain Cook) and the

the circumstances of the flood-tide entering the sound from the south, rendered the existence of a passage this way very doubtful. And, as the wind in the morning had become favourable for getting out to sea, the Captain tells us, he resolved to spend no more time in searching for a passage in a place that promised so little success. Besides, if the land on the west should prove to be islands, agreeable to the late Russian Discoveries, we could not fail of getting far enough to the north, and that in good time; provided we did not lose the season in searching places, where a passage was not only doubtful, but improbable. We were now upward of 520 leagues westward of any part of Baffin's, or of Hudson's Bay, and whatever passage there may be, it must be, or at least part of it must lie to the north of latitude 72 deg. Who could expect to find a passage or strait of such extent?—Notwithstanding the plausibility in the face of this reasoning, our readers will see, it is little more than mere conjecture; and might we hazard our opinion against the judgement of so able a navigator, we must confess, that the latter is not coincident with his usual precision; nor can we think his conduct, in the above search, corresponds in all particulars with his usual assiduity. This is certain, the arm near Cape Hinchinbrook, above alluded to, and the northern part of Hudson's Bay, lie between the same parallels of latitude; and it has been the united opinion of all our most skilful navigators and geographers, that if a N. W. passage does exist, it must be through Hudson's, or Baffin's bay. As to the Russian Discoveries, or those of any other monopolizing, trading companies, they have been of little service hitherto to navigation, and, with respect to their credit, of very small value. It were therefore to be wished, that the report of so able an officer as Mr. Gore had been more particularly attended to; for we think, if the desirable passage can be found, it must be in a lower latitude than 72 deg. and through some arm or strait. This is our own private opinion, and we do not wish to infringe upon the judgement of others, we wish this sacred privilege always to remain inviolate, with every member of civil society.

On Monday, the 18th, about three o'clock A. M. we weighed, and made sail to the southward, down the inlet, with a light northerly breeze. We were enabled to shorten our run out to sea, by discovering another passage into this inlet, to the S. W. of that by which we entered. It is separated from the other, by an island that extends 18 leagues in the direction of S. W. and N. E. to which our Commodore gave the name of Montague Island. In this south-western channel are several islands. Those situated in the entrance next the open sea, are elevated and rocky. Those that lie within are low; and as they were totally free from snow, they were, for this reason, called Green Islands. At two o'clock, P. M. the wind veered to the S. W. by S. which put us under the necessity of plying. We first stretched over to within the distance of two miles of the eastern shore, and tacked in 53 fathoms. When we stood back to Montague Island, we discovered a ledge of rocks, some under water, and others above the surface. We afterwards met with some others towards the middle of the channel. These rocks rendering it dangerous to ply during the night, we spent it in standing off and on, under Montague Island; for the depth of water is so great, that we could not cast anchor. The next morning, at break of day, we steered for the channel between the Green Island and Montague Island, which is between two and three leagues in breadth. About eight in the evening, we had a perfect calm; when we let go our anchors at the depth of twenty-one fathoms, over a muddy bottom, distant about two miles from Montague Island. After the calm had continued till ten o'clock the succeeding morning, a slight breeze sprung up from the north, with which we again weighed and made sail.

Having got out into the open sea, by six in the evening, we discovered that the coast trended W. by S. as far as the eye could reach. To the place we had just left the Commodore gave the name of Prince William's Sound. It seems to occupy, at least, one degree and

a half of latitude, and two degrees of longitude, exclusive of the branches or arms, with whose extent we are unacquainted. The natives, in general, are of a middling stature, though many of them are under it. They are square, or strong chested, with short, thick necks, and large broad visages, which are, for the most part, rather flat. The most disproportioned part of their body appeared to be their heads, which were of great magnitude. Their teeth were of a tolerable whiteness, broad, well set, and equal in size. Their noses had full, round points, turned up at the tip; and their eyes, though not small, were scarcely proportioned to the largeness of their faces. They have black hair, strong, straight, and thick. Their beards were, in general thin, or deficient; but the hairs growing about the lips of those who have them, were bristly or stiff, and often of a brownish colour. Some of the elderly men had large, thick, straight beards. The variety of their features is considerable. Very few, however, can be said to be handsome, though their countenance usually indicates frankness, vivacity, and good nature; and yet some of them shewed a reserve and fullness in their aspect. The faces of some of the women are agreeable; and many of them, but principally the younger ones, may easily be distinguished from the other sex, by the superior softness of their features. The complexion of some of the females, and of the children, is white, without any mixture of red. Many of the men, whom we saw naked, had rather a swarthy cast, which was scarcely the effect of any stain, it not being a custom among them to paint their bodies. Both sexes, young and old, of this sound, are all clothed in the same manner. Their ordinary dress is a sort of close frock, or rather robe, which sometimes reaches only to the knees, but generally down to the ancles. It has, at the upper part a hole just sufficient to admit the head, with sleeves reaching to the wrist. These frocks are composed of the skins of various animals, and they are commonly worn with the hairy side outwards. Some of the natives have their frocks made of the skins of fowls, with only the down left on them, which they glue upon other substances. The seams, where the different skins are sewed together, are usually adorned with fringes or tassels of narrow thongs, cut out of the same skins. A few have a sort of cape or collar, and some have a hood; but the other is the most customary form, and appears to constitute the whole of their dress in fair weather. When it is rainy, they put over this another frock, made with some degree of ingenuity from the intestines of whales, or some other large animal, prepared with such skill, as to resemble, in great measure, our gold-beater's leaf. It is formed so as to be drawn tight round the neck; and its sleeves extend down to the wrist, round which they are fastened with a string. When in their canoes, they draw the skirts of this frock over the rim of the hole in which they sit, so that the water by this means is prevented from entering; at the same time it keeps the men dry upwards, for no water can penetrate through it. Yet, if not constantly kept moist, it is apt to crack or break. This frock, as well as the common one made of skins, is nearly similar to the dress of the natives of Greenland. Though the inhabitants of this inlet, in general, do not cover their legs or feet, yet some of them wear a kind of skin-stockings, reaching half way up their thighs. Few of them are without mittens for their hands, formed from the skin of a bear's paw. Those who wear any thing on their heads, resembled, in this particular, the people of Nootka Sound, having high truncated conical caps, composed of straw, and sometimes of wood. The hair of the men is commonly cropped round the forehead and neck, but the females suffer it to grow long; and the greatest part of them tie a lock of it on the crown, while a few, after our custom, club it behind. Both men and women perforate their ears with several holes, about the outer and lower part of the edge, wherein they suspend small bunches of beads. They likewise perforate the septum of the nose, through which they often thrust the quill-feathers of birds, or little bending ornaments, made of a tubulous shelly substance, strung on

on a stiff cord, of the length of three or four inches, which give them a ridiculous and grotesque appearance. But the most extraordinary fashion, adopted by some of the natives of both sexes, is their having the under-lip cut quite through lengthwise, rather below the swelling part. This incision frequently exceeds two inches in length, and, either by its natural retraction while the wound is still fresh, or by the repetition of some artificial management, assumes the appearance and shape of lips, and becomes sufficiently large to admit the tongue through. When a person with his under-lip thus slit, was first seen by one of our sailors, he immediately exclaimed, that the man had two mouths; which, indeed, it greatly resembles. They fix in this artificial mouth, a flat, narrow kind of ornament, made principally out of a solid shell or bone, cut into small narrow pieces, like teeth, almost down to the base, or thick part, which has, at each end, a projecting bit, that serves to support it when put into the divided lip, the cut part then appearing outwards. Some of them only perforate the lower-lip into separate holes; on which occasion the ornament consists of the same number of distinct shelly studs, the points of which are thrust through these holes, and their heads appear within the lip, not unlike another row of teeth under their natural ones. Such are the native ornaments of these people: but we observed among them many beads of European manufacture, chiefly of a pale blue colour, which are hung in their ears, or about their caps, or are joined to their lip ornaments, which have a little hole drilled in each of the points to which they are fastened, and others to them, till they sometimes hang even as low as the point of the chin. In this last case, however, they cannot remove them with such facility; for, with respect to their own lip-ornaments, they can take them out with their tongues at pleasure. They likewise wear bracelets of beads made of a shelly substance resembling amber, and of a cylindrical form. They are, in general, so fond of ornaments of some kind or other, that they fix a variety of things in their perforated lip; one of them appeared with two of our iron nails projecting like prongs from it; and another man attempted to put a large brass button into it. The men often paint their faces of a black colour, and of a bright red, and sometimes of a bluish or leaden hue, but not in any regular figure. The women puncture or stain the chin with black, that comes to a point in each of their cheeks; a custom similar to which is in vogue, as we have been informed, among the Greenland females. Upon the whole, we have not in any country seen savages, who take more pains than these do to disfigure their persons with imaginary ornaments.

They have two sorts of canoes; the one large and open, the other small and covered. They differ no otherwise from the great boats in Greenland, than in the form of the head and stern, particularly of the former, which somewhat resembles a whale's head. The framing consists of slender pieces of wood; and the outside is composed of the skins of seals, or other sea animals, stretched over the wood. Their small canoes are constructed nearly of the same form and materials with those of the Esquimaux. Some of these carry two persons. Their fore part is curved like the head of a violin. Their weapons and implements for hunting and fishing, are the same with those used by the Greenlanders. Many of their spears are headed with iron, and their arrows are generally pointed with bone. Their larger darts are thrown by means of a piece of wood, about a foot long, with a small groove in the middle, which receives the dart: at the bottom is a hole for the reception of one finger, which enables them to grasp the piece of wood much firmer, and to throw with greater force. For defensive armour they have a sort of jacket, or a coat of mail, formed of laths, fastened together with sinews, which render it very flexible, though it is so close as not to admit a dart or arrow. It serves only to cover the trunk of the body, and may, not improperly, be compared to the stays worn by our women.

We had not an opportunity of seeing any of the ha-

bitations of the natives, as none of them dwell in the bay where our ships anchored, or where any of us landed: but with respect to their domestic utensils, they brought, in their canoes, some round and oval wooden dishes, rather shallow; and others of a cylindrical form, considerably deeper. The sides are one piece bent round, after the manner of our chip-boxes, but thick, and nearly fastened with thongs, the bottoms being neatly fixed in with small pegs of wood. Others were somewhat smaller, and of a more elegant figure, not unlike a large oval butter-boat, without any handle, but shallower; these were composed of a piece of wood, or some horny substance, and were sometimes neatly carved. They had in their possession a great number of little square bags, made of the same gut with their exterior frocks, curiously adorned with very small red feathers interwoven with them, in which were contained several very fine sinews, and bundles of small cord, made out of them, plaited with extraordinary ingenuity. They likewise had some models in wood of their canoes; chequered baskets, wrought so closely as to hold water, and a considerable number of little images, four or five inches high, either of wood, or stuffed, which were covered with a piece of fur, and embellished with quill-feathers, with hair fixed on their heads. We could not determine whether these were intended merely as children's toys, or were applied to superstitious purposes. They have many instruments formed of two or three hoops, or concentric pieces of wood, having a cross bar fixed in the middle, by which they are held. To these they fix a number of dried barnacle shells, with threads, which, when shaken, produce a loud noise, and thus serve the purpose of a rattle. This contrivance is probably a substitute for the rattling bird at King George's Sound. It is uncertain with what kind of tools their wooden utensils, frames of canoes, &c. are made; the only one that we observed among them being a sort of stone-adze, somewhat resembling those of Otaheite, and other islands in the Pacific Ocean. They have a great quantity of iron knives, some of which are rather curved, others straight, and some very small ones, fixed in longish handles, with the blades bent upwards. They have also knives, some of which are almost two feet in length, shaped, in a great measure like a dagger, with a ridge towards the middle. These they wear in sheaths of skin, hung by a thong round their necks, under their robe or frock. It is probable, that they use them only as weapons, and that their other knives are applied to different purposes. Whatever they have, is as well made as if they were provided with a complete chest of tools; and their plaiting of sinews, sewing, and small-work on their little bags, may be found to vie with the neatest manufactures in any part of the globe. Upon the whole, considering the uncivilized state of the natives of this sound, their northerly situation, amidst a country almost continually covered with snow, and the comparative wretched materials they have to work with, it appears, that, with respect to their skill and invention, in all manual operations, they are at least upon a footing with any other people in the islands of the great Pacific Ocean.

The animal food, we saw them eat, was either roasted, or broiled: they feed also on dried fish. Some of the former that was purchased, had the appearance of bear's flesh. They likewise eat a larger sort of fern-root, either baked, or dressed in some other method. Some of our company observed them to eat freely of a substance, which we imagined was the interior part of the pine bark. Their drink, in all probability, is water; for, in their canoes, they brought snow in their wooden vessels, which they swallowed by mouthfuls. Their manner of eating is decent and cleanly, for they constantly took care to remove any dirt that might adhere to their food: and though they would sometimes eat the raw fat of a sea animal, yet, they did not fail to cut it carefully into mouthfuls. To all appearance, their persons were always free from filth; and their utensils, in general, were kept in excellent order, as were also their boats.

The language of these people seemed difficult to be understood;

understood: this, perhaps, was not owing to any confusion, or indistinctness in their sounds, but to the various significations which their words bear: for they frequently made use of the same word on different occasions; though, probably, if we could have had a longer intercourse with them, this might have proved a mistake on our part. Among the few words and phrases the ingenious Mr. Anderson was enabled to procure, we have selected the following:

Ahleu	- - -	<i>A Spear</i>
Amilhtoo	- - -	<i>A Piece of white bear's skin</i>
Keelashuk	- - -	<i>Guts of which they make jackets</i>
Natooneshuk	- - -	<i>The Skin of a sea-otter</i>
Lukluk	- - -	<i>A Brown shaggy skin</i>
Namuk	- - -	<i>An Ornament for the ear</i>
Aa	- - -	<i>Yes</i>
Chilke	- - -	<i>One</i>
Taiha	- - -	<i>Two</i>
Tokke	- - -	<i>Three</i>
Chukelo	- - -	<i>Four</i>
Koeheene	- - -	<i>Five</i>
Takulai	- - -	<i>Six</i>
Keichillho	- - -	<i>Seven</i>
Klu or Klieu	- - -	<i>Eight</i>

PHRASES.

Yaut	- - -	<i>I'll go: or, shall I go?</i>
Whachai	- - -	<i>Shall I keep it? Do you give it me?</i>
Tawuk	- - -	<i>Keep it</i>
Weona or Veena	- - -	<i>Stranger (calling to one)</i>
Ooonaka	- - -	<i>Will you barter for this that belongs to me?</i>
Keeta	- - -	<i>Give me something?</i>
Naema	- - -	<i>Give me something in exchange?</i>
Akashou	- - -	<i>What's the name of that?</i>

With regard to the numerals, Mr. Anderson observes, that the words corresponding to ours, after passing three, are not certain.

Our knowledge of the animals of this part of America, is entirely derived from the skins that were brought by the natives for sale. These were principally of bears; common, and pine martins; sea-otters, seals, racoons, small ermines, foxes, and the whitish cat or lynx. Among these various skins, the most common are those of racoons, martins, and sea-otters, which form the ordinary dress of these people: but the skins of the martins which were in general of a far lighter brown than those of Nootka, were greatly superior to them in point of fineness; whereas those of the sea-otters, which, as well as the martins, were much more plentiful here than at Nootka, seemed to be considerably inferior in the thickness and fineness of their fur, though they far exceeded them with respect to size; and were, for the most part, of the glossy black sort. The skins of seals, and bears, were also very common: the former were, in general, white; and many of the bears, here, were of a dark brown hue. Besides these animals, there is the white bear, of whose skins the natives brought several pieces, and some complete skins of cubs. Here is also the wolverene, or quickhatch, whose skin has very bright colours; and a larger species of ermine than the common one, varied with brown, and scarcely any black on its tail. The skin of the head of some very large animal was brought to us, but we could not decide positively what it was; though from the colour, and shagginess of the hair, and its not resembling any land animal, we conjectured, that it might be that of the male ursine-seal, or sea-bear. But one of the most beautiful skins that fell under our consideration, is that of a small animal near a foot in length, of a brown colour on the back, with a number of obscure whitish specks, the sides being of a bluish ash-colour, with a few of those specks. The tail is about a third part of the length of the body, and is covered with whitish hair. This animal is doubtless the same with that which is called by Mr. Stæhlin, in his account of the New Northern Archipelago, the spotted field-mouse: but whether it is really of the mouse kind, or a squirrel, we could not learn, nor determine, for want of entire skins; though Mr. Anderson was inclined to believe, that it is the same animal which some of our naturalists have described under the appellation of the castor-marmot. The great number of skins that we saw at this place, demonstrates the abundance of the various animals we have mentioned; yet, it is somewhat remarkable, that we neither met with the skins of the moose, nor of the common species of deer. As to the birds we found the halcyon, or great king-fisher, having fine bright colours; the shag; the white headed eagle; and the humming bird, which often flew about our ships, while we lay at anchor; though it cannot be supposed to live here, during the winter, which must be extremely severe. The water-fowl seen by us were black sea-pies, with red bills, such as we met with at Van Diemen's Land. Some of our people brought down a snipe, a grouse, and some plovers: but notwithstanding the water-fowl were numerous, particularly the geese and ducks, they were so shy, that it was a difficult matter to get within shot; in consequence of which, we procured a very inconsiderable supply of them as refreshments. The duck is about the size of our common wild one; of a deep black, with red feet, and a short pointed tail. Its bill is white, tinged towards the point with red, and has a large black spot, almost square, near its base, on each side, where it is also somewhat distended. On the forehead is a large triangular white spot; and on the hinder part of the neck is one still larger. The colours of the female are much less vivid than those of the male; and she has none of the ornaments of the bill, excepting those of the two black spots, which are rather obscure. We observed a species of the diver, which seems peculiar to this place. In size, it is equal to a partridge, and has a short, black, compressed bill. Its head, and the upper part of its neck, are of a brownish black; and the remainder of its body is of a deep brown, waved obscurely with black, except the under part, which is totally of a blackish cast, minutely varied with white. We found also a small land bird, of the finch kind, about the bigness of a yellow-hammer; but we imagined it to be one of those which change their colours with the season, and with their different migrations. It was, at this time, of a dusky brown with a reddish tail; and the supposed male had, on the crown of the head, a large yellow spot, with some varied black on the upper part of its neck; but the latter was on the breast of the female.

With respect to the fish, what the natives brought to us for sale, were torrk and halibut. We caught some sculpins about the ship; and star-fish of a purplish hue, that had sixteen or eighteen rays. The rocks were almost destitute of shell-fish, and the only one of this tribe that fell under our notice, was a reddish crab, covered with large spines. We observed few vegetables of any kind, and the trees that chiefly grew about this sound, were the Canadian, and spruce pine, some of which were of a considerable size. The metals we saw these people possessed of, were iron and copper; both which, but particularly the former, were in such abundance, that their lances and arrows were pointed with them. The ores which they used to paint themselves with, were a brittle, unctuous red ochre or iron ore; a pigment of a bright blue; and black lead: but each of these articles seemed to be very scarce among them. These people must, certainly, have received from some more civilized nation, the beads and iron found among them. We were, doubtless, the first Europeans, with whom they ever had a direct communication; and it remains only to be determined, from what quarter they had procured our manufactures. And it is more than probable, that they had obtained these articles, through the intervention of the more inland tribes, either from the settlements about Hudson's Bay, or those on the lakes of Canada; unless we can admit the supposition, that the Russians, from Kamtschatka, have already extended their traffic to this distance; or that the natives of their most easterly Fox Islands carry on an intercourse along the coast, with the inhabitants of Prince William's Sound. As to copper these people, perhaps, procure themselves,

themselves, or, at most, it passes to them through very few hands; for when they offered any of it by way of barter, they used to express its being in sufficient plenty among them, by pointing to their weapons, as if they would intimate, that, having so much copper of their own, they had no occasion to increase their stock. However, if the natives of this inlet are furnished with European commodities by means of the intermediate traffic to the eastern coast, it is remarkable, that they should never, in return, have supplied the more inland Indians with some of their sea-otter skins, which would undoubtedly have appeared, at one time or other, in the environs of Hudson's Bay. But that does not appear to be the case; and the only method by which we can account for this, must be by considering the very great distance; which, though it might not prevent European articles of commerce from coming so far, as being so uncommon, might hinder the skins, which are common, from passing through more than two or three tribes, who might make use of them for their own cloathing, and send others, which they reckoned of inferior value as being of their own animals to the east, till they reached the traders at the European settlements.

On Wednesday the 20th of May, having took our departure from Prince William's Sound, we directed our course to the S. W. with a gentle breeze. This was succeeded by a calm, at four o'clock, the next morning, which was soon followed by a breeze from the S. W. This veering to the N. W. we continued to stretch to S. W. and passed a lofty promontory, in the latitude of 59 deg. 10 min. long. 207 deg. 45 min. It having been discovered on Princess Elizabeth's birth-day, Captain Cook gave it the name of Cape Elizabeth. As we could see no land beyond it, we flattered ourselves, that it was the western extremity of the continent: but fresh land soon appearing in sight, bearing W. S. W. convinced us of our mistake. The wind had increased to a strong gale, and forced us to a considerable distance from the coast: but, on the 22nd, P. M. the gale abated, and we stood for Cape Elizabeth. On Saturday the 23d, at noon, Cape Elizabeth bore W. distant 10 leagues; at which time, new land was seen, bearing S. W. which, it was imagined, connected Cape Elizabeth with the land we had seen towards the west. We stood to the southward till the next day, at noon, when we were three leagues from the coast, which we had seen on the 22nd. More land was discovered, extending to the southward, whereon was seen a ridge of mountains, whose summits were covered with snow. This point of land lies in latitude 58 deg. 15 min. Its longitude is 207 deg. 42 min. And by what the Commodore could gather from Beering's voyage and chart, he supposed it to be, what he called Cape St. Hermogenes. But the account of that voyage, as well as the chart, is so extremely inaccurate, that it is almost impossible to discover any one place, which the navigator either saw or touched at. In the chart a space is pointed out, where Beering is supposed to have seen no land. This favoured Mr. Strahlen's account, who makes Cape St. Hermogenes, and the land discovered by Beering to the S. W. of it, to be a cluster of islands, and that St. Hermogenes is one of those that are destitute of wood. This appeared to be confirmed by what we now saw; and we entertained the pleasing hopes of finding here a passage northward, without being obliged to proceed any farther to the S. W.

We were detained by light airs and calms off the Cape, till two o'clock, A. M. of the 25th, when a breeze springing up, we steered along the coast, and perceived that the land of Cape St. Hermogenes was an island, about six leagues in circumference, separated from the coast by a channel, one league in breadth. Some rocks are to be seen above water to the north of this island; and on the N. E. side of the rocks, we had from 30 to 20 fathoms water. At noon St. Hermogenes bore S. E. distant 8 leagues; the land to the N. W. extending from S. half W. to near W. In this last direction, it ended in a low point, named Point Banks. The ship was, at this time, in latitude 58 deg. 41 min. longitude 207 deg. 44 min. In this station the land was in sight, bearing N. W. which, it was thought, connected Cape

Elizabeth with this S. W. land. When we approached it, we observed it was an unconnected group of high islands and rocks; and from the nakedness of their appearance, the Captain named them the Barren Isles: they are situated in latitude 59 deg. three leagues distant from Cape Elizabeth, and five from Point Banks. It was our intention to have passed through one of the channels by which these islands are divided; but a strong current setting against us, we went to leeward of them all. The weather, which had been thick and hazy, cleared up towards the evening, when we perceived a very lofty promontory, whose elevated summit appeared above the clouds, forming two exceeding high mountains. Captain Cook named this promontory Cape Douglas, in honour of his friend Dr. Douglas, canon of Windsor. It is situated 12 leagues from Point Banks, and 10 to the westward of the Barren Isles; in latitude 58 deg. 56 min. and longitude 206 deg. 10 min. Between this point and Cape Douglas is a large deep Bay, which, from our observing some smoke upon Point Banks, received the name of Smokey Bay. At day break on the 26th, being to the northward of the Barren Isles, we discovered more land, extending from Cape Douglas to the north. It consisted of a chain of very high mountains; one of which, being much more conspicuous than the rest, obtained the name of Mount St. Augustine. Having a fresh gale we stood to the N. W. till eight, when we found, that what we had supposed to be islands were summits of mountains, connected by the lower land. This was covered wholly with snow, from the tops of the mountains down to the sea-beach; and had in every other respect, the appearance of a great continent. Captain Cook was now fully convinced, that no passage could be discovered by this inlet; and his continuing to explore it was more to satisfy others, than to confirm his own opinion. At this time Mount St. Augustine bore N. W. distant three leagues. It is of a conical figure, and rises to a prodigious height; but whether it be an island, or part of the continent, is not yet ascertained. Perceiving that nothing was to be done to the west, we stood over to Cape Elizabeth, under which we fetched at about five in the afternoon. Between Cape Elizabeth and a lofty promontory, which was named Cape Bede, is a bay, wherein we might have anchored; but, the Captain having no such intention, we tacked and stood to the westward, with a very strong gale, accompanied with rain and hazy weather. Next morning the gale abated, and about three o'clock in the afternoon, the weather cleared up; Cape Douglas bearing S. W. by W. and the depth of water being 40 fathoms, over a rocky bottom. From Cape Bede the coast trended N. E. by E. with a chain of mountains in land, in the same direction. We had now the mortification to discover low land in the middle of the inlet, extending from N. N. E. to N. E. by E. but, as it was supposed to be an island, we were not much discouraged.

On Thursday, the 28th, A. M. having but little wind, the ship drove to the southward, and in order to stop her, we dropped a kedge-anchor, with an eight inch hauler. But, in bringing the ship up, we lost both that and the anchor. However, we brought the ship up, with one of the bowers, and spent a considerable part of the day in sweeping for them, but without effect. We were now in the latitude of 59 deg. 51 min. the low land extended from N. E. to S. E. the nearest part distant two leagues; and the land on the western shore about seven leagues. A strong tide set to the southward, out of the inlet; it was the ebb, and ran almost four knots in an hour. At ten o'clock it was low water. Though the water had become thick, and resembled that in rivers, we were encouraged to proceed, by finding it as salt as in the ocean, even at low water. Three knots was the strength of the flood tide; and the stream continued to run up till four in the afternoon. At eight o'clock in the evening we stood up the inlet, to the north. Soon after the wind veered to this quarter, and blew in squalls, attended with rain; but this did not hinder us from plying up while the flood continued, which was till the next morning at near five o'clock, when we anchored about

about two leagues from the eastern shore; and our latitude was 60 deg. 8 min. Some low land, which we supposed to be an island, lay under the western shore, distant between three and four leagues. The weather clearing up, a ridge of mountains appeared; and two columns of smoke were visible on the eastern shore. At one o'clock A. M. we weighed, and plied up under double reefed top-sails, having a strong gale at N. E.

On Saturday the 30th, the gale having much abated, we plied up from two o'clock A. M. till near seven, and then anchored under the shore to the eastward, in 19 fathoms water. At noon two canoes, with a man in each, came off to the ship, nearly from that part where we had seen the smoke the day before. They resembled strongly those we had seen in Prince William's Sound, both in dress and person: their canoes were also constructed in the same manner; and one of them had a large beard, and a countenance like the common sort of people in the Sound. When the flood made, we weighed, stood over to the western shore, and fetched under a bluff point to the N. W. This, with the point on the opposite shore, contracted the breadth of the channel to about four leagues, through which a prodigious tide ran. It had a terrible appearance, and we were ignorant whether the water was thus agitated by the stream, or by the dashing of the waves against sands or rocks. We kept the western shore aboard, that appearing to be the safest. In the evening, about eight o'clock, we anchored under a point of land, bearing N. E. distant about three leagues, and lay there during the ebb. Till we arrived at this station, the water retained an equal degree of saltness, both at high and low water, and was as salt as that which is in the ocean: but now the appearances of a river evidently displayed themselves. The water, taken up at this ebb, was much fresher than any we had tasted; whence we concluded that we were in a large river, and not in a strait, which had a communication with the northern seas: but, having proceeded thus far, Captain Cook was anxious to have stronger proofs; therefore, on the thirty-first, in the morning, we weighed with the flood, and drove up with the tide, having but little wind. Near eight o'clock, many of the natives, in one large canoe, and several small ones, paid us a visit. The latter had only one person on board each; but the larger ones contained men, women, and children. We bartered with them for some of their fur dresses, made of the skins of animals, particularly those of sea-otters, martins, and hares, also salmon, halibut, and a few of their darts; for which, in return, we gave them old clothes, beads, and pieces of iron. These last they call goone; but, in general, their language is nearly the same as that used in Prince William's Sound. At nine o'clock, we anchored in sixteen fathoms water, almost two leagues from the western shore, the ebb being already began. It ran but three knots an hour at its greatest strength, and fell, after we had anchored, twenty-one feet upon a perpendicular. In order to determine the direction, and other particulars respecting the inlet, Captain Cook dispatched two boats, and when the flood tide made, followed them with the two ships; but, after driving about ten miles, we anchored, having a dead calm and strong tide against us. At the lowest of the ebb, the water at and near the surface, was perfectly fresh, though retaining a considerable degree of saltness, if taken above a foot below it. Besides this, we had other convincing proofs of its being a river, such as thick muddy water, low shores, trees, and rubbish of various kinds, floating backward and forward with the tide. In the afternoon we received another visit from the natives, who bartered largely with our people, without so much as attempting one dishonest action.

On Monday the 1st of June, at two o'clock, A. M. the master, who commanded the two boats, returned, informing us that he found the inlet or river contracted to one league in breadth, and that it took a northerly course through low land on each side. He advanced about three leagues through this narrow part, which he found from 20 to 17 fathoms deep. While the stream ran down the water was perfectly fresh, but it became

brackish when it ran up, and more so near high water. Three leagues to the northward of this search, the master discovered another separation in the eastern chain of mountains, through which he supposed it probable, the river ran in a direction N. E. but this was thought by the captain to be only another branch, and that the main channel continued in a northern direction between the two chains of mountains. The pleasing hopes of finding a passage were no longer entertained; but as the ebb was spent, we took the advantage of the next tide to get a closer view of the eastern branch: in order to determine whether the low land on the east was an island or not. For this purpose we weighed with the first of the flood, and stood over for the eastern shore. At eight o'clock a breeze sprang up in a direction opposite to our course, so that we despaired of reaching the entrance of the river. By reason of this untoward circumstance, two boats were dispatched, under the command of Lieutenant King, to make such observations as might enable us to form some tolerable idea of the nature and course of the river. About ten o'clock, the Resolution and Discovery anchored in nine fathoms water. The Commodore observing the strength of the tide to be so powerful, that the boats could not make head against it, made a signal for them to return, before they had proceeded half way to the entrance of the river. The only knowledge concerning the grand question, obtained by this tide's work, was, that all the low land, which we had imagined to be an island, was one continued tract from the great river to the foot of the mountains, terminating at the south entrance of this eastern branch, which the Commodore denominated the river Turnagain.

The low land begins again on the north side of this river, and extends from the foot of the mountains, to the bank of the great river, forming before the river Turnagain a large bay. Having entered this, the flood set very strong into the river, the water falling 20 feet upon a perpendicular, from which circumstances it was evident, that a passage was not to be expected by this side river, any more than by the main branch: but, as the water at ebb, though much fresher, retained a considerable degree of saltness, it is probable that both these branches are navigable by ships much farther; and that a very extensive inland communication lies open, by means of this river and its several branches. We had traced it to the latitude of 61 deg. 30 min. and the long. of 210 deg. which is upwards of 210 miles from its entrance, and saw no appearance of its source. The time we spent in the discovery—(Here the Commodore having left a blank in his journal, which he had not filled up with any particular name, the earl of Sandwich very properly directed it to be called Cook's river) The time we spent in the discovery of Cook's river ought not to be regretted, if it should hereafter prove useful to the present, or any future age: but the delay thus occasioned was an essential loss to us, who had a greater object in view. The season was far advanced, and it was now evident, that the continent of North America extended much farther to the west than we had reason to expect from the most approved charts.

In the afternoon Lieutenant King was again sent, with orders from the captain to land on the S. E. side of the river, where he was to display the flag; and, in his majesty's name, to take possession of the country and Cook's river. He was ordered also to bury a bottle in the earth, containing some English coin of 1772, and a paper, whereon were written the names of our ships, and the date of our discovery. In the mean time the ships were got under way; but a calm ensued, and the flood tide meeting us, we found it necessary to cast anchor; the point where Mr. King landed bearing S. distant two miles. This point of land was named Point Possession. On Mr. King's return we were informed, that after he had landed he saw several of the natives with their arms extended, an attitude, he supposed, meant to signify their peaceable disposition, and to convince him that they were without weapons. Observing his attendants were armed with muskets, they were alarmed, and requested, by expressive signs, that he would

would lay them down. This was immediately complied with, and then Mr. King and his party were permitted to walk up to them. They now appeared to be very sociable and cheerful. Mr. Law, surgeon of the *Discovery*, being one of the party, purchased a dog, and taking it towards the boat, immediately shot it dead. At this they seemed exceedingly surprized; and, not thinking themselves safe in such company, they walked away; but it presently appeared, that they had concealed their spears and other weapons in the bushes close behind them.

At high-water we weighed anchor, and with a faint breeze stood over to the west shore, where the next morning, being Tuesday the second, we anchored, on account of the return of the flood. Soon after we were visited by several of the natives in canoes, who bartered their skins, and afterwards parted with their garments, many of them returning perfectly naked. Among others, they brought a great quantity of the skins of white rabbits, and red foxes, but only two or three of those of otters. We also purchased some pieces of halibut and salmon. They preferred iron to every thing we offered them in exchange. The lip-ornaments were less in fashion among them than at Prince William's Sound; but those which pass through the nose were more frequent, and in general considerably longer. They had likewise more embroidered work on their garments, quivers, knife-cases, and other articles. At half past ten we weighed, and plied down the river with a gentle breeze at south; when, by the inattention of the man at the lead, our ship struck upon a bank, nearly in the middle of the river. It is pretty certain that this bank occasioned that strong agitation of the stream, with which we were so much surprized when turning up the river. We had twelve feet of water about the ship, at the lowest of the ebb, but the bank was dry in other parts. When our ship came aground Captain Cook made a signal for the *Discovery* to anchor. We were afterwards informed that she had been almost ashore on the west side of the bank. About five o'clock in the afternoon, as the flood tide came in, the ship floated off without sustaining any damage, or occasioning the least trouble. We then stood over to the west shore, where we anchored, in deep water, to wait for the ebb, the wind being still unfavourable to us. At ten o'clock at night we weighed with the ebb, and about five the next morning, the 3d, the tide being finished, we cast anchor on the west shore, about ten miles below the bluff point. In this station we were visited by many of the natives, who attended us all the morning: their company was highly acceptable to us, as they brought with them a quantity of fine salmon, which they exchanged for some of our trifles. Several hundred weight of it was procured for the two ships. The mountains now, for the first time after our entering the river, were free from clouds, and we saw a volcano in one of those on the western side. Its latitude is 60 deg. 23 min. and it is the first high mountain north of Mount St. Augustin. The volcano is near the summit, and on that part of the mountain next the river. It emits a white smoke, but no fire. The wind continuing southerly, we still tided it down the river.

On Friday the 5th, in the morning, we arrived at the place where we had lost our kedge anchor, which we attempted, though unsuccessfully, to recover. Before our departure from hence, we were again visited by some of the natives in six canoes from the eastern shore. The points of their spears and knives are made of iron; some of the former, indeed, are made of copper. Their spears resemble our spoons; and their knives, for which they have sheaths, are of considerable length. Except these and a few glass beads, every thing we saw among them was of their own manufacture. A very beneficial fur trade might certainly be carried on with the natives of this vast coast: but without a northern passage, it is too remote for Great Britain to be benefited by such commerce. It should however be noted, that almost the only valuable skins, on this west side of North America, are those of the sea-otter; their other

skins are of an inferior quality. As the skins are used by these people only for cloathing themselves, they, perhaps, are not at the trouble of dressing more of them, than they require for this purpose. This is probably the chief cause of their killing the animals, for they receive principally their supply of food from the sea and rivers: but if these were accustomed to a constant trade with foreigners, such an intercourse would increase their wants, by acquainting them with new luxuries, to be enabled to purchase which, they would become more assiduous in procuring skins; and in this country, without doubt, a plentiful supply might be obtained.

This day, the ebb tide making in our favour, we weighed, and with a gentle breeze at S. W. plied down the river: the flood obliged us to anchor again; but the next morning of Saturday the 6th we got under sail with a fresh breeze, passed the Barren Islands about eight o'clock, A. M. and at noon Cape St. Hermogenes bore S. S. E. eight leagues distant. We intended to go through the passage between the island of that name and the main land, but the wind soon after failed us; on which account we abandoned the design of carrying the ship through that passage: northward of it the land forms a bay, a low rocky island lying off the N. W. point. Some other islands, of a similar appearance, are scattered along the coast between here and Point Banks. At eight in the evening, St. Hermogenes extended from S. half E. to S. S. E. and the rocks bore S. E. distant three miles. About midnight we passed the rocks, and bore up to the southward; and on the 7th at noon St. Hermogenes bore N. distant four leagues. The southernmost point of the main land lay N. half W. five leagues distant. The latitude of this promontory is 58 deg. 15 min. and its longitude 274 deg. 24 min. It was named after the day in our calendar, Cape Whitsunday; and a large bay to the west of it was called Whitsunday Bay. At midnight we stood in for the land, and at seven in the morning of the eighth we were within four miles of it, and less than two miles from some sunken rocks, bearing W. S. W. Here we anchored in thirty-five fathoms water. To the west of the bay are some small islands. To the southward the sea coast is low, with projecting rocky points, having small inlets between them. We were now in the latitude of 57 deg. 52 min. 30 sec. The land here forming a point, it was named Cape Greville, in lat. 57 deg. 33 min. long. 207 deg. 15 min. distant from St. Hermogenes 15 leagues. On the 9th, 10th and 11th, we continued plying up the coast.

On Friday the 12th, in the evening, the fog clearing up, we descried land twelve leagues distant, bearing W. and we stood in for it early the next morning. At noon an elevated point, which we called Cape Barnabas, in lat. 57 deg. 13 min. bore N. N. E. distant ten miles. The point to the S. W. had an elevated summit, which terminated in two round hills, and was therefore called Two-headed Point. At six in the evening, being about midway between Cape Barnabas and Two-headed Point, a point of land was observed bearing S. 69 deg. W. On the fourteenth, at noon, we observed in lat. 56 deg. 49 min. The land seen the preceding evening, now appeared like two islands. We were up with the southernmost part of it the next morning, and perceived it to be an island, which we named Trinity Island. It lies in lat. 56 deg. 36 min. long. 205 deg. distant from the continent three leagues, between which rocks and islands are interspersed. In the evening, at eight, we were within a league of the small islands. The westernmost point of the continent, now in view, we called Cape Trinity, it being a low point facing Trinity Island. Having reason at this time to expect foggy weather, we stretched out to sea, and passed two or three rocky islets near the east end of Trinity Island. This we weathered, and in the afternoon steered west-southerly, with a gale at S. S. E. No land appearing on Monday the fifteenth at noon, and the gale and fog increasing, we steered W. N. W. under such sail as we could haul the wind with; sensible of the danger of running before a strong gale, in the vicinity of an unknown coast and in a thick fog. It was however become necessary to run some risk,

risk, when the wind was favourable to us; as we were convinced that clear weather was generally accompanied with westerly winds.

On Tuesday, the 16th, at four o'clock, A. M. the fog being now dispersed, we found ourselves, in a manner, surrounded with land. The extreme of the main, at N. E. was a point of land we had seen through the fog, and was therefore named Foggy Cape. It is situated in latitude 56 deg. 31 min. About nine o'clock, we discovered the land to be an island, nine miles in circumference, in lat. 56 deg. 10 min. long. 202 deg. 45 min. we named it Foggy Island; and we supposed, from its situation, that it is the island on which Beering had bestowed the same appellation. Three or four islands bore N. by W. A point, with pinnacle rocks upon it, bore N. W. by W. called Pinnacle Point; and a cluster of islets, S. S. E. about nine leagues from the coast. On the 17th, at noon, the continent extended from S. W. to N. by E; the nearest part distant 7 leagues: at the same distance from the continent, a group of islands was seen to the N. W. On the 18th we had clear, pleasant weather, and it was a calm the greatest part of the day. One of our people, on board a boat dispatched to the Discovery, shot a most beautiful bird. It is smaller than a duck, and the colour is black, except that the fore part of the head is white: behind each eye, an elegant yellowish-white crest arises: the bill and feet are of a reddish colour. The first of these birds were seen to the southward of Cape St. Hermogenes; after which we saw them daily, and frequently in large flocks. We were also visited by most of the other sea-fowls, that are usually met with in the northern oceans; and seldom a day passed without our seeing whales, seals, and other fish of great magnitude. In the afternoon we steered west, for the channel between the islands and the continent. On Friday, the 19th, at day break, we were not far from it, and perceived several other islands, within those we had already seen, of various dimensions. Between these islands, and those we had seen before, there appeared to be a clear channel, for which we steered; and, at noon our latitude was 55 deg. 18 min. in the narrowest part of the channel. Of this group of islands, the largest was now upon our left, and is called Kodiak, as we were afterwards informed. Other islands appeared to the southward, as far as an island could be seen. They begin in the longitude of 200 deg. 15 min. east, and extend about two degrees to the westward. Most of these islands are tolerably high, but very barren and rugged, exhibiting romantic appearances, and abounding with cliffs and rocks. They have several bays and coves about them; and some fresh-water streams descend from their elevated parts, but the land is not adorned with a single tree or bush. Plenty of snow still remained on many of them, as well as on those parts of the continent which appeared between the innermost islands. By four o'clock, in the afternoon, we had passed all the islands to the south of us; and soon after we had got through the channel, the Discovery, which was two miles astern, fired three guns, and brought to, making a signal to speak with us. A boat being sent off to her, returned immediately with Captain Clerke. He informed the commodore, that some natives in three or four canoes, having followed his ship for some time, at last got under the stern; one of whom made many signs, having his cap off, and bowing in the European manner. A rope was then handed down from the ship, to which he fastened a thin wooden box, and after he had made some more gesticulations, the canoes left the Discovery. Soon after the box was opened, and found to contain a piece of paper, carefully folded up, whereon some writing appeared, which was supposed to be in the Russian language. To this writing was prefixed the date of 1778. and a reference was made therein to the year 1776. Though unable to decipher the alphabet of the writer, we were convinced by his numerals, that others had preceded us in visiting these dreary regions. At first Captain Clerke imagined, that some Russians had been shipwrecked here; and that seeing our ships, these unfortunate persons were induced

No. 67.

thus to inform us of their situation. Deeply impressed with sentiments of humanity on this occasion, he was in hopes the Resolution would have stopped till they had time to join us; but no such idea ever occurred to Captain Cook. If this had really been the case, he supposed, that the first step such persons would have taken, in order to secure relief, would have been, to send some of their people off to the ships in the canoes. He, therefore, rather thought the paper was intended to communicate some information, from a Russian trader, who had lately visited these islands, to be delivered to any of his countrymen who should arrive; and that the natives, supposing us to be Russians, had brought off the note. In consequence of this opinion, the Captain ordered sail to be made, and we steered westward. At midnight, we beheld a vast flame ascend from a burning mountain, and observed several fires within land.

On Saturday, the 20th, at two o'clock A. M. some breakers were seen, distant two miles; others appeared a-head; on our larboard side they were innumerable; and also between us and the land. We cleared them, though with difficulty, by holding a south course. These breakers were produced by rocks, many of which were above water: they are very dangerous, and extend seven leagues from land. We got on the outside of them about noon, when we observed in latitude 54 deg. 44 min. longitude 198 deg. The nearest land was an elevated bluff point, which we called Rock Point. It bore N. distant 8 leagues; and a high round hill, called Halibut Head, bore S. W. distant 13 leagues. On the 21st, Halibut Island extended from N. by E. to N. W. This island is seven leagues in circumference, and except the head, is very low and barren. We were kept at such a distance from the continent, by the rocks and breakers, that we had but a very imperfect view of the coast between Halibut Island and Rock Point. We could, however, perceive the main land covered with snow; particularly some hills, whose elevated tops towered above the clouds to a most stupendous height. A volcano was seen on the most south-westerly of these hills, which perpetually threw up immense columns of black smoke: it is at no great distance from the coast, and lies in the latitude of 54 deg. 48 min. and in longitude 195 deg. 45 min. Its figure is a complete cone, and the volcano is at the summit of it: remarkable as it may appear, the wind, at the height to which the smoke of the volcano rose, often moved in an opposite direction to what it did at sea, even in a fresh gale. In the afternoon, having three hours calm, upwards of 100 halibuts were caught by our people, some of which weighed upwards of a hundred pounds, and none of them less than twenty each. They were highly acceptable to us. We fished in 35 fathoms water, about four miles distant from the shore; during which time, we were visited by a man in a small canoe, who came from a large island. When he drew near to the ship, he uncovered his head and bowed, as the other had done the preceding day, when he came off to the Discovery. It appeared very plain to us, that the Russians had some communication with these people, not only from their politeness, but from an additional proof that we now were favoured with: for our new visitor had on a pair of green cloth breeches, and a jacket of black cloth, under the frock of his own country. He had with him a grey fox-skin, and some fishing implements: also a bladder, wherein was some liquid, which we supposed to be oil: he opened it, drank a mouthful, and then closed it up again. His canoe was smaller than any one of those we had seen before, though of the same construction: like others who had visited the Discovery, he used the double-bladed paddle. His features resembled those of the natives of Prince William's Sound, but he was perfectly free from any kind of paint; and his lip had been perforated in an oblique direction, but at this visit he had not any kind of ornament in it. Many of the words frequently used by the natives of the Sound, were repeated to him, but he did not seem to understand any of them, owing either to his ignorance of the dialect, or our erroneous pronunciation.

7 A

On

On Monday, the 22d, the wind shifted to the S. E. and, as usual, was attended with thick rainy weather. In the evening, fearing we might fall in with land, we hauled to the southward, till two the next morning, and then bore away west; yet we made but little way. At five o'clock P. M. we had an interval of sunshine, when we saw land bearing N. 59 deg. W. On Wednesday, the 24th, at six o'clock A. M. we saw the continent; and at nine it extended from N. by E. to S. W. by W. the nearest part distant four leagues. The next morning we had clear weather, inasmuch, that we clearly saw the volcano, the other mountains, and all the main land under them. A large opening was likewise seen between several islands and a point of the land. We now steered to the southward; when, having got without all the land in sight, we steered west, the islands lying in that direction. By eight o'clock we had passed three of them, all of a good height; and more were now observed to the westward. In the afternoon, the weather became gloomy, and afterwards turned to a mist, the wind blowing fresh at east, we therefore hauled the wind to the southward till day break, on Friday the 26th, when we resumed our course to the west. We derived but little advantage from daylight, the weather being so thick that we could not discover objects at the distance of a hundred yards; but as the wind was moderate, we ventured to run. About half an hour after four, the sound of breakers alarmed us on our larboard bow. We brought the ship to, and anchored in twenty-five fathoms water. The Discovery who was not far distant anchored also. Some hours after, the fog being a little dispersed, we discovered the imminent danger we had escaped. We were three quarters of a mile from the N. E. side of an island: two elevated rocks were about half a league from us, and from each other. Several breakers also appeared about them; and yet Providence had safely conducted the ships through in the dark, between those rocks, which we should not have attempted to have done in a clear day; and to so commodious an anchoring-place, which, on account of our miraculous escape, received the name of Providence Bay. During the night, the wind blew fresh at south, but in the morning was more moderate, and the fog, in a great measure dispersed. At seven o'clock, we weighed, and steered between the island near which we had anchored, and a small one not far from it. The breadth of the channel does not exceed a mile, and the wind failed before we could pass through it. We were therefore glad to anchor in 34 fathoms water. Land now presented itself in every direction. That to the south extended, in a ridge of mountains, to the S. W. which we afterwards found to be an island, called Oonalashka. Between this, and the land to the north, which we supposed to be a group of islands, there appeared to be a channel in a N. W. direction. On a point, west from the ship, and at a distance of three quarters of a mile, we perceived several natives and their habitations. To this place we saw two whales towed in, which we supposed had just been killed. A few of the inhabitants came off, at different times, to the ships, and engaged in a little traffic with our people, but never continued with us above a quarter of an hour at a time. They seemed, indeed, remarkably shy; though we could readily discover they were not unacquainted with vessels, similar, in some degree to ours. Their address expressed a degree of politeness which we had never experienced among any of the savage tribes. Being favoured, about one o'clock, P. M. with a light breeze, and the tide of flood, we weighed, and directed our course to the channel last mentioned; expecting when we had passed through, either to find the land trend away to the northward, or that we should discover a passage out to sea, to the west; and we soon found we were right in our conjectures. After we had got under sail, the wind veered to the N. and we were obliged to ply. In the evening, the ebb made it necessary for us to anchor within three leagues of our last station.

On Sunday, the 28th, at day-break, we got again under sail, and were wafted up the passage by a light breeze

at fourth; this was succeeded by variable light airs from all directions. We had, however, a rapid tide in our favour, and the Resolution got through before the ebb made. The Discovery was not equally fortunate, for she was carried back, got into the race, and found a difficulty in getting clear of it. Being now through the channel, we observed the land on one side, trending W. and S. W. and that on the other side to N. This encouraged us to hope that the continent had taken a new direction in our favour. Finding our water ran short, and expecting to be driven about in a rapid tide, without wind sufficient to govern the ship, we stood for a harbour on the south side of the passage, but were driven beyond it; and, that we might not be forced back through the passage, anchored near the southern shore, in 28 fathoms, and out of the reach of the strong tide, though even here it ran five knots an hour. In this station we were visited by several of the natives, in separate canoes. They bartered some fishing implements for tobacco. A young man among them oversteer his canoe, while he was along side of one of our boats. He was caught hold of by one of our people, but the canoe was taken up by one of his countrymen, and carried ashore. In consequence of this accident, the youth was obliged to come into the ship, where he accepted an invitation into the cabin, without any surprize or embarrassment. He had on an upper garment, resembling a shirt, made of the gut of a whale, or some other large sea-animal. Under this he had another of the same form, made of the skins of birds with the feathers on, curiously sewed together; the feathered side placed next the skin. It was patched with several pieces of silk stuff, and his cap was embellished with glass beads. His cloaths being wet, we furnished him with some of our own, which he put on with as much readiness as we could have done. From the behaviour of this youth, and that of several others, it evidently appeared that these people were no strangers to Europeans, and to many of their customs. Something in the appearance of our ships, however, greatly excited their curiosity; for, such as had not canoes to bring them off, assembled on the neighbouring hills to have a view of them. At low water we towed the ship into the harbour, where we anchored in nine fathoms water, the Discovery arriving soon after. A boat was now sent off to draw the seine, but we caught only a few trout, and some other small fish. We had scarce anchored, when a native of the island brought another note on board, similar to that which had been given to Captain Clerke. He presented it to our Commodore, but as it was written in the Russian language neither he, nor any of our company, could read it. As it could not be of any use to us, and might be of consequence to others, Captain Cook returned it to the bearer, accompanied with a few presents; for which he expressed his thanks, as he retired, by several low bows. On the 29th we saw along the shore, a group of the natives of both sexes, seated on the grass, partaking of a repast of raw fish, which they seemed to relish exceedingly. We were detained by thick fogs and a contrary wind, till Thursday the 2d of July, in this harbour. It is called by the natives Samganoodha, and is situated on the north side of the island of Oonalashka, in lat. 53 deg. 55 min. long. 193 deg. 30. min. and in the strait which separates this island from those to the north. It is about a mile broad at the entrance, and runs in about four miles S. by W. It narrows towards the head, the breadth there not exceeding a quarter of a mile. Plenty of good water may be procured here, but not a stick of wood of any kind.

On Thursday, the 2d of July, we steered from the harbour of Samganoodha, having a gentle breeze at S. S. E. to the northward, and met with nothing to obstruct our course: for on the one side the Isle of Oonalashka trended S. W. and on the other, no land was to be seen in a direction more northerly than N. E. all which land was a continuation of the same group of islands that we had fallen in with, on the 25th of the preceding month. That which is situated before Samganoodha, and constitutes the north-eastern side of the passage,

passage, through which we came, is called Oonella; and its circumference is 21 miles. Another island, lying to the northward of it, bears the name of Acootan: it is much superior in size to Oonella, and has in it some very lofty mountains, at this time covered with snow. It appeared that we might have passed with great safety between these two islands and the continent, whose south-western point opened off the north-eastern point of Acootan, and proved to be the same point of land that we had discerned when we left the coast of the continent, the 25th of June, in order to go without the islands. It is called by the natives Oonemack; and is situated in lat. 54 deg. 30 min. long. 192 deg. 30 min. E. Over the Cape, which is high land, we perceived a round elevated mountain, at present covered with snow. At six o'clock A. M. this mountain bore E. 2 deg. N. and two hours afterwards not any land was to be seen. Concluding, therefore, that the coast of the continent had now inclined to the north-eastward, we steered the same course till one o'clock the following morning, when the watch stationed on deck gave intimation of their seeing land. Upon this we wore, and for the space of about two hours stood towards the S. W. after which we renewed our course to the E. N. E. At six we discovered land a-head, bearing S. E. distant five leagues. As we advanced we discovered a connected chain of land. At noon we perceived that it extended from S. S. W. to E. the part nearest to us being at the distance of five leagues. We now observed in lat. 55 deg. 21 min. long. 195 deg. 18 min. E. At six o'clock A. M. we sounded, and found a bottom of black sand, at the depth of 48 fathoms. At this time we were four leagues from the land, and its eastern part in sight was in the direction of E. S. E. to appearance an elevated round hummock.

On Saturday the 4th, at eight o'clock, A. M. we saw the coast from S. S. W. and E. by S. and at intervals we could discern high land behind it, covered with snow. Soon after we had a calm, when all hands were employed in fishing; and as our people were now put on two thirds allowance, what each caught he might eat or sell. Fortunate for them, they caught some tons of fine fish, which proved a most seasonable supply; for the ship provisions, what with salt and maggots eating into the beef and pork, and the rats and the weavils devouring the heart of the bread, the one was little better than putrid flesh, and the other, upon breaking, would crumble into dust. Among the fish we caught with hook and line, were a great number of excellent cod. At noon we had an easterly breeze and clear weather, when we were about six leagues from the land, which extended from S. by W. to E. by S. and the hummock, seen the preceding evening, bore S. W. by S. nine leagues distant. A great hollow swell convinced us, that there was no main land westward near us. At six o'clock, P. M. we steered a northerly course, when the wind veering to the S. E. enabled us to steer E. N. E. The coast lay in this direction, and the next day, at noon, was four leagues distant. On the 6th and 7th we made but little way, the wind being northerly. On Wednesday, the 8th, the coast extended from S. S. W. to E. by N. and was all low land, and it is not improbable that this extends to a considerable distance towards the S. W. and that those places which we sometimes supposed to be inlets or bays, are nothing more than valleys between the mountains. This day we hooked plenty of fine cod.

On Thursday the 9th, in the morning, having a breeze at N. W. we steered E. by N. in order to make a nearer approach to the coast. At noon we observed in latitude 57 deg. 49 min. long. 201 deg. 33 min. E. at the distance of two leagues from land, which was observed to extend from S. by E. to N. E. being all a low coast, with points projecting in several places. In advancing towards the N. E. we had found that the depth of water gradually decreased, and the coast trended more and more northerly; but we observed the ridge of mountains behind it continued to lie in the same direction as those that were more westerly; so that the extent of the low land between the coast and the foot of the mountains insensibly increased. Both the low

and high grounds were totally destitute of wood, but apparently covered with a green turf, the mountains excepted, which were covered with snow. As we proceeded along the coast, with a light westerly breeze, the water shoaled gradually from fifteen to ten fathoms, though we were eight or ten miles distant from the shore. About eight o'clock in the evening a lofty mountain, which had been some time within sight, bore S. E. by E. distant twenty-one leagues. Several other mountains, forming the same chain, and much further distant, bore E. 3 deg. N. The coast was seen to extend as far as N. E. half N. where it seemed to terminate in a point, beyond which it was both our hope and expectation that it would assume a more easterly direction. But not long afterwards we perceived low land, that extended from behind this point, as far as N. W. by W. where it was lost in the horizon; and behind it we discerned high land, appearing in hills detached from each other. Thus the fine prospect we had of getting to the northward, vanished in an instant. We stood on till nine o'clock, and then the point before-mentioned was one league distant, bearing N. E. half E. Behind the point is a river, which, at its entrance, seemed to be a mile in breadth. The water appeared somewhat discoloured, as upon shoals; but a calm would have given it a similar aspect. It seemed to take a winding direction, through the extensive flat which lies between the chain of mountains towards the S. E. and the hills to the north-westward. It abounds, we apprehend, with salmon, as many of those fish were seen leaping before the entrance. The mouth of this river, which we distinguished by the name of Bristol River, lies in lat. 58 deg. 27 min. and in long. 201 deg. 55 min. E.

On the 10th at day-break we made sail to the W. S. W. with a light breeze at N. E. At eleven o'clock A. M. thinking that the coast towards the N. W. terminated in a point, bearing N. W. by W. we steered for that point, having ordered the *Discovery* to keep a-head; but before that vessel had run a mile, she made a signal for shoal water. At that very time we had the depth of seven fathoms, yet before we could get the head of our ship the other way, we had less than five; but the *Discovery's* soundings were less than four fathoms. We now stood back three miles to the N. E. but observing a strong tide setting to the W. S. W. in a direction to the shoal, we brought the ships to anchor in ten fathoms, over a sandy bottom. Two hours after the water fell upwards of two feet, which proved that it was the tide of ebb that came from Bristol River. In the afternoon, the wind having shifted to the S. W. we weighed at four o'clock, and made sail towards the S. having several boats a-head employed in sounding. When we had passed over the south end of the shoal, in six fathoms water, we afterwards got into fifteen fathoms, in which we let go our anchors again between eight and nine in the evening; some part of the chain of mountains on the south-eastern shore being in sight, and bearing S. E. half S. and the most westerly land on the other shore bearing N. W. In the course of this day we had descried high land which bore N. 60 deg. W.

On Saturday the 11th, at two o'clock A. M. we weighed anchor, with a gentle breeze at S. W. by W. and plied to windward till nine, when judging the flood tide to be against us, we anchored in twenty-four fathoms. At one o'clock P. M. the fog, that had this morning prevailed, dispersing, and the tide becoming favourable, we weighed and plied to the south-westward. Towards the evening we had some thunder. We had heard none before from the time of our arrival on this coast, and what we now heard was at a great distance. In the morning of the 12th we steered a N. W. course, and at ten o'clock saw the continent. At noon it extended from N. E. by N. to N. N. W. quarter W. and an elevated hill appeared in the direction of N. N. W. distant ten leagues. This we found to be an island, to which, on account of its figure, Captain Cook gave the name of Round Island. It is situated in the latitude of 58 deg. 37 min. and in longitude 200 deg. 6 min. E. distant from the continent
seven

seven miles. At nine in the evening, having steered a northerly course to within three leagues of the shore, we tacked in fourteen fathoms; the extremities of the coast bearing S. E. half E. and W. We stretched along shore till two the next morning, when we suddenly got into six fathoms water, being at the same time two leagues from shore. After we had edged off a little, our depth of water gradually increased, and at noon we sounded in twenty fathoms. Round Island at this time bore N. 5 deg. E. and the western extreme of the coast N. 16 deg. W. It is an elevated point, and having calm weather while we were off it, for this reason it was named Calm Point. On the 14th and 15th, having little wind, we advanced but slowly. At times a very thick fog came on. Our soundings were from twenty-six to fourteen fathoms. We had pretty good success in fishing, for we caught plenty of cod and some flat fish.

On Thursday the 16th, at five o'clock A. M. the fog clearing up, we found ourselves nearer the shore than we expected. Calm Point bore N. 72 deg. E. and a point about eight leagues from it, in a westerly direction, bore N. 3 deg. E. only three miles distant. Between these two points the coast forms a bay, in several parts of which the land could scarcely be seen from the mast-head. Another bay is on the north-western side of the last-mentioned point, between it and a high promontory, which now bore N. 36 deg. W. at the distance of sixteen miles. About nine o'clock the Commodore dispatched Lieutenant Williamson to this promontory, with orders to go ashore and observe what direction the coast took beyond it, and what might be the produce of the country; which, when viewed from the ships, had but a sterile appearance. We here found the flood-tide setting strongly towards the N. W. along the coast. At noon it was high water, and we cast anchor at the distance of twelve miles from the shore, in twenty-four fathoms. About five in the afternoon, the tide beginning to make in our favour, we weighed, and drove with it, there being no wind. When Mr. Williamson returned, he reported that he had landed on the point, and having ascended the most elevated hill, found that the most distant part of the coast in sight was nearly in a northerly direction. He took possession of the country in the name of his Britannic Majesty, and left on the hill a bottle containing a paper, on which the names of our ships and of their commanders, and the date of the discovery, were inscribed. The promontory, which he named Cape Newenham, is a rocky point, of considerable height, and is seated in latitude 58 deg. 42 min. and in longitude 197 deg. 36 min. E. Over, or within it, two lofty hills arise one behind another, of which the innermost, or easternmost, is the highest. The country, as far as Mr. Williamson could discern, produces not a single tree or shrub. The hills were naked, but on the lower grounds there grew grass and plants of various kinds, very few of which were at this time in flower. The Lieutenant met with no other animals than a doe with her fawn, and a dead sea-horse or cow that lay on the beach: of the latter animals we had seen a considerable number from the ships. Cape Newenham is the northern boundary of the extensive gulph or bay situated before the river Bristol, which, in honour of the Admiral, Earl of Bristol, received from the Commodore the distinction of Bristol Bay. Cape Ooneemak forms the southern limit of this bay, and is eighty-two leagues distant, in the direction of S. S. W. from Cape Newenham. At eight o'clock in the evening we steered to the N. W. and N. N. W. round the cape, which at noon the next day was four leagues distant, bearing S. by E. The most advanced land towards the north, bore N. 30 deg. E. and the nearest part of the coast was three leagues and a half distant. During the afternoon there was but little wind, so that by ten o'clock in the evening we had only proceeded three leagues on a northerly course.

Saturday the 18th, at eight o'clock A. M. we were steering N. by W. when the depth of water suddenly increased to seven and five fathoms; on which account

we brought to, till a boat from each of the ships was sent a-head to sound, and then we steered to the N. E. At noon, when the water deepened to seventeen fathoms, Cape Newenham was twelve leagues distant, bearing S. 9 deg. E. the north-eastern extremity of the land in sight bore N. 66 deg. E. and the distance of the nearest shore was four leagues. Our latitude was 59 deg. 16 min. N. Before one o'clock the boats a-head displayed the signal for shoal-water. They had only two fathoms; but at the same time the ships were in six. By hauling more to the north, we continued nearly in the same depth till between five and six o'clock, when our boats finding less and less water, Captain Cook made the signal to the Discovery, which was then a-head, to cast anchor, and both ships soon came to. In bringing up the Resolution, her cable parted at the clinch, so that we were obliged to make use of the other anchor. We rode in 6 fathoms water, over a bottom of sand, at the distance of about five leagues from the continent. Cape Newenham now bore S. distant 16 leagues. The farthest hills we could perceive towards the north, bore N. E. by E. and low land stretched out from the more elevated parts as far as N. by E. Without this there was a shoal of stones and sand, dry at half ebb. The two masters having been sent, each in a boat, to sound between this shoal and the coast, reported, on their return, that there was a channel, in which the soundings were 6 and 7 fathoms, but that it was rather narrow and intricate. At low water, we attempted to get a hawser round the lost anchor, but did not then succeed; however being resolved not to leave it behind us, while there remained the prospect of recovering it, we persevered in our endeavours; and at length, in the evening of the 20th, we had the desired success. While thus employed, the Commodore ordered Captain Clerke to send his master in a boat to search for a passage in a S. W. direction. He accordingly did so, but could find no channel in that quarter; nor did it appear, that there was any other way to get clear of the shoals, than by returning by the same track in which we had entered: for though, by following the channel we were now in, we might, perhaps, have got farther down the coast; and though this channel might have probably carried us at last to the northward, clear of the shoals, yet the attempt would have been attended with extreme hazard; and, in case of ill-success, there would have been a great loss of time, that we could not conveniently spare. These reasons induced the Commodore to return by the way which had brought us in, and thus avoid the shoals. The latitude of our present station, by lunar observations, was 59 deg. 37 min. 30 sec. N. and our longitude 197 deg. 45 min. 48 sec. E. The most northern part of the coast that we could discern from this station, was supposed to be situate in lat. 60 deg. It formed, to appearance, a low point, to which was given the name of Shoal Nefs. The tide of flood sets to the northward, and the ebb to the southward: it rises and falls five or six feet upon a perpendicular, and we reckon that it is high water at eight o'clock on the full and change days.

On Tuesday the 21st, at three o'clock A. M. having a gentle breeze at N. N. W. we set sail, with three boats a-head employed in sounding. Notwithstanding this precaution, we met with greater difficulty in returning than we had in advancing; and were at length under the necessity of anchoring, to avoid the danger of running upon a shoal that had only a depth of five feet. While we lay at anchor, twenty-seven Americans, each in a separate canoe, came off to the ships, which they approached with some degree of caution. As they advanced they hallooed, and extended their arms; thereby intimating, as we understood, their peaceable intentions, and how cordially they were ready to receive us. Some of them at last came near enough to receive a few trifling articles, which we threw to them. This gave encouragement to the others to venture alongside; and a traffic quickly commenced between them and our people, who obtained wooden vessels, bows, darts, arrows, dresses of skins, &c. in exchange for which the natives accepted whatever we offered.

offered them. They appeared to be the same sort of people with those we had met with all along this coast; and they wore in their lips and noses the same sorts of ornaments; but they were not so well clothed, and were much more dirty. We thought them to be perfectly unacquainted with any civilized nation; they were ignorant of the use of tobacco; nor did we observe in their possession any foreign article, unless a knife may be considered as such. This indeed was nothing more than a piece of common iron fitted in a handle made of wood, so as to serve the purpose of a knife. However, these people understood so well the value and use of this instrument, that it seemed to be almost the only article they thought worth purchasing. The hair of most of them was shaved, or cut short off, a few locks being left on one side and behind. They wore for a covering on their heads, a hood of skins, and a bonnet seemingly made of wood. One part of their dresses, which we procured, was a kind of girdle of skin, made in a very neat manner, with trappings depending from it, and passing between the thighs, so as to conceal the adjacent parts. From the use of this girdle, it is probable, that they sometimes go in other respects naked, even in this high northern latitude; for it can scarcely be supposed that they wear it under their other cloathing. Their canoes were covered with skins, like those we had lately seen; but they were broader, and the hole wherein the person sits was wider, than in any of those we had before met with. Our boats returning from sounding gave them some alarm, so that they all departed sooner than perhaps they otherwise would have done.

On Wednesday the 22d, we got clear of the shoals, yet we could not venture to steer towards the west during the night, but spent it off Cape Newenham. On the 23d, at day-break, we stood to the northward, the Discovery being ordered to go a-head. When we had proceeded two leagues, our soundings decreased to six fathoms. Being apprehensive, that, if we continued this course, we should meet with less water, we hauled to the south. This course brought us gradually into 18 fathoms water; upon which we ventured to steer a little westerly, and afterwards due west, when we at length found 26 fathoms. At noon, by observation, we were in lat. 58 deg. 7 min. long. 194 deg. 22 min. east. We now steered W. N. W. the depth of water increasing gradually to 34 fathoms. On Saturday the 25th, in the evening, having little wind, and an exceeding thick fog, we let go our anchors in 30 fathoms. At six o'clock the next morning, the weather clearing up, we set sail, and stood to the northward. After we had proceeded on this course for the space of nine leagues, the wind veered to the N. so that we were obliged to steer more westerly. On Tuesday the 28th, at noon, we had clear sunshine for a few hours, during which several observa-

tions were made, which determined our lat. to be 59 deg. 55 min. and our long. 190 deg. 6 min. but the time-keeper gave 189 deg. 59 min. difference only 7 min. On the 29th, in the morning, we discovered land, bearing N. W. by W. distant 6 leagues. We stood towards it till between ten and eleven, when we tacked in 24 fathoms, being then a league from the land, which bore N. N. W. It was the south-eastern extreme, and formed a perpendicular cliff of great height; upon which it received from the Captain the name of Point Upright. Its lat. is 60 deg. 17 min. long. 187 deg. 30 min. east. More land was perceived to the westward of this point; and, at a clear interval, we discerned another portion of high land, bearing W. by S. and this seemed to be perfectly separated from the other. On Thursday, the 30th, at four o'clock P. M. Point Upright bore N. W. by N. distant 6 leagues. A light breeze now springing up at N. N. W. we steered to the north-eastward till four the next morning, when the wind veered to the east; we then tacked, and stood to the N. W. The wind, not long after, shifting to S. E. we steered N. E. by N. and continued this course with soundings, from 35 to 20 fathoms, till noon the following day.

Saturday, August the 1st, we observed in lat. 60 deg. 58 min. long. 191 deg. east. The wind now becoming north-easterly, we first made a stretch of about ten leagues towards the N. W. and then, as we observed no land in that direction, we stood back to the E. for the space of 14 or 15 leagues, and met with a considerable quantity of drift-wood. On the 2d, we had variable light winds, with showers of rain the whole day. In the morning of Monday, the 3d, we resumed our northward course. At noon, by observation, our lat. was 62 deg. 34 min. long. 192 deg. E. Between three and four o'clock this afternoon, Mr. Anderson, Captain Cook's surgeon of the Resolution, expired, after he had lingered under a consumption upwards of a twelvemonth. He was a sensible, intelligent young man; an agreeable companion; had great skill in his profession; and had acquired a considerable portion of knowledge in other branches of science. Our readers will doubtless have observed, how useful an assistant he had proved in the course of this voyage; and had it pleased God to have prolonged his life to a later period, the public might have received from him such communications on the various parts of natural history of the several places he visited, as would have abundantly shewn he was worthy of a higher commendation than we have here given him. His funeral was performed with the usual ceremonies at sea; after which Mr. Law, surgeon of the Discovery, was removed into the Resolution, and Mr. Samwell, the surgeon's first mate of the Resolution, was appointed to succeed Mr. Law as surgeon of the Discovery.

SOON after Mr. Anderson had resigned his breath, we discovered land to the westward, distant 12 leagues. We supposed it to be an island; and the Commodore, to perpetuate the memory of the deceased, for whom he had a very great regard, distinguished it by the name of Anderson's Island. On Tuesday, the 4th, at three in the afternoon, we saw land extending from N. N. E. to N. W. We steered towards

wards

wards it till four, when, being four or five miles distant from it, we tacked; and, not long afterwards, the wind failing, we let go our anchors in 13 fathoms, over a sandy bottom, at the distance of about two leagues from land. Our lat. was now 64 deg. 27 min. N. and long. 194 deg. 18 min. E. We could at intervals, discern the coast extending from E. to N. W. and an island of considerable elevation, bearing W. by N. nine miles distant. The land before us, which we imagined to be the continent of America, appeared rather low next the sea; but inland it rose in hills, which seemed to be of a tolerable height. It had a greenish hue, and was apparently destitute of wood, and free from snow. While our ships remained at anchor, we observed that the tide of flood came from the eastward, and set to the westward, till between the hours of ten and eleven; from which time, till two o'clock the next morning, the stream set to the E. and the water fell three feet. The flood running both longer and stronger than the ebb, we concluded that there was a westerly current besides the tide. Wednesday the 5th, at ten o'clock in the morning, we ran down, and soon after anchored between the island and the continent in seven fathoms. Not long after we had cast anchor, Captain Cook, accompanied by Mr. King and some other officers, landed upon the island. He hoped to have had from it a prospect of the coast and sea towards the west; but in that direction the fog was so thick, that the view was not more extensive than it was from our ships. The coast of the continent seemed to incline to the north, at a low point, named by us Point Rodney, which bore from the island N. W. half W. at the distance of three or four leagues; but the high land, which assumed a more northerly direction, was perceived at a much greater distance. The lat. of this island is 64 deg. 30 min. N. and its long. is 193 deg. 57 min. E. It is about 12 miles in circumference. The surface of the ground principally consists of large loose stones, covered in many places with moss and other vegetables; of which 20 or 30 different species were observed, and most of them were in flower. But the Captain saw not a tree or shrub either on the island or upon the neighbouring continent. Near the beach where he landed, was a considerable quantity of wild purslain, long-wort, pease, &c. some of which he took on board for boiling. He saw several plovers, and other small birds; a fox was also seen. He met with some decayed huts, built partly under-ground. People had lately been upon the island; and it is more than probable that they often repair to it, there being a beaten path from one end to the other. At a small distance from that part of the shore where our gentlemen landed, they found a sledge, which induced Captain Cook to give the island the appellation of Sledge Island. It appeared to be such a one as is used by the Russians in Kamtschatka, for the purpose of conveying goods from one place to another over the snow or ice. It was about 20 inches in breadth, and 10 feet in length, had a sort of rail-work on each side, and was shod with bone. Its construction was admirable, and its various parts were put together with great neatness; some with wooden pins, but for the most part with thongs or lashings of whale bone; in consequence of which, the Captain imagined that it was entirely the workmanship of the natives. We weighed anchor at three o'clock A. M. of the 6th, and made sail to the N. W. with a light breeze from the southward. Having afterwards but little wind, and that variable, we made but a slow progress; and, at eight o'clock in the evening, finding the ships getting into shoal-water, we anchored in seven fathoms, our distance from the coast being about two leagues. Sledge island then bore S. 51 deg. E. nine or ten leagues distant. Soon after we had let go our anchors, the weather, which had been misty, cleared up, and we perceived high land extending from N. 40 deg. E. to N. 30 deg. W. seemingly disjoined from the coast near which we lay at anchor, which appeared to extend to the north-eastward. We at the same time saw an island bearing N. 81 deg. W. at the distance of eight or nine leagues.

It seemed to be of small extent, and was named King's Island. We rode at anchor till eight the next morning, when we weighed, and steered a N. W. course. The weather being clear towards the evening, we obtained a sight of the north-western land, distant about three leagues. We passed the night in making short boards, the weather being rainy and misty, and the wind inconsiderable. Between four and five in the morning of the 8th, we again had a sight of the N. W. land; and not long afterwards having a calm, and being driven by a current towards the shore, we thought proper to anchor in 12 fathoms water, at the distance of about two miles from the coast. Over the western extremity is a lofty peaked hill, situate in the long. of 192 deg. 18 min. E. and in the lat. of 65 deg. 36 min. N. A north-easterly breeze springing up at eight o'clock, we weighed, and made sail to the south-eastward, hoping to find a passage between this N. W. land and the coast, near which we had cast anchor in the evening of the 6th. But we quickly got into seven fathoms water, and perceived low land connecting the two coasts, and the elevated land behind it. Persuaded that the whole was a continued coast, we now tacked and steered for its north-western part, near which we anchored in 17 fathoms. The weather at present was very thick and rainy; but at four the next morning it cleared up, and enabled us to discern the neighbouring land. A lofty steep rock or island bore W. by S. another island to the northward of it, and considerably larger, bore W. by N. the peaked hill before mentioned, S. E. by E. and the point that was under it, S. 32 deg. E. Under this hill is some low land, extending towards the N. W. the extreme point of which was now about one league distant, bearing N. E. by E. Over it, and also beyond it, we observed some high land, which we imagined was a continuation of the continent. This point of land, which the Commodore distinguished by the name of Cape Prince of Wales, is the western extreme of all America hitherto known. It stands in the long. of 191 deg. 45 min. E. and in the lat. of 65 deg. 46 min. N. We fancied that we saw some people on the coast; and perhaps we were not mistaken in our supposition, as some elevations like stages, and others resembling huts, were observed at the same place. This morning, at eight o'clock, a faint northerly breeze arising, we weighed anchor; but our sails were scarcely set, when it began to blow and rain with great violence, there being at the same time misty weather. The wind and current were in contrary directions, raising such a sea, that it often broke into the ship. Having plied to windward with little effect till two o'clock in the afternoon, we stood for the island which we had perceived to the westward, intending to cast anchor under it till the gale should abate. But upon our nearer approach to this island, we found that it was composed of two small islands, neither of which exceeded three or four leagues in circumference. As these could afford us little shelter, we did not come to an anchor, but continued to stretch towards the W. and about eight o'clock in the evening, we saw land extending from N. N. W. to W. by S. the distance of the nearest part being six leagues. We stood on till ten o'clock, and then made a board towards the E. in order to pass the night.

On Monday the 10th, at break of day, we resumed our westward course for the land seen by us the preceding evening. At eleven minutes after seven o'clock, it extended from S. 72 deg. W. to N. 41 deg. E. Betwixt the south-western extremity, and a point bearing W. six miles distant, the coast forms a spacious bay, in which we dropped our anchors at ten in the forenoon, about two miles from the northern shore, over a gravelly bottom, at the depth of ten fathoms. The northern point of this bay bore N. 43 deg. E. its southern point S. 58 deg. W. the bottom of the bay, N. 60 deg. W. between two and three leagues distant; and the two islands that we had passed the preceding day, were at the distance of 14 leagues, bearing N. 72 deg. E. When steering for this bay we observed, on the north

north shore, a village, and some people, who seemed to have been thrown into confusion, or fear, at the sight of our vessel's. We could plainly perceive persons running up the country with burdens upon their shoulders. At this village Captain Cook proposed to land; and accordingly went with three armed boats, accompanied by some of the officers. Thirty or forty men, each of whom was armed with a spontoon, a bow, and arrows, stood drawn up on an eminence near the houses; three of them came down towards the shore, on the approach of our gentlemen, and were so polite as to pull off their caps, and make them low bows. Though this civility was returned, it did not inspire them with sufficient confidence to wait for the landing of our party; for, the instant they put the boats ashore, the natives retired. Captain Cook followed them alone, without any thing in his hand; and, by signs and gestures, prevailed on them to stop, and accept some trifling presents: in return for these, they gave him two fox-skins, and a couple of sea-horse teeth. The Captain was of opinion, that they had brought these articles down with them for the purpose of presenting them to him; and that they would have given them to him, even if they had expected no return. They seemed very timid and cautious: intimating their desire, by signs, that no more of our people should be suffered to come up. On the Captain's laying his hand on the shoulder of one of them, he started back several paces; in proportion as he advanced, they retreated, always in the attitude of being ready to make use of their spears; while those on the eminence, were prepared to support them with their arrows. Insensibly, the Captain, and two or three of his companions, introduced themselves among them. The distribution of a few beads among some of them, soon created a degree of confidence, so that they were not alarmed, when the Captain was joined by a few more of his people; and, in a short time, a kind of traffic was entered into. In exchange for tobacco, knives, beads, and other articles, they gave a few arrows, and some of their clothing; but nothing that our people had to offer, could induce them to part with a spear or a bow. These they held in continual readiness, never quitting them, except at one time, when four or five persons laid theirs down, while they favoured our party with a song and a dance; and even then, they placed them in such a manner, that they could lay hold of them in a moment. Their arrows were pointed either with stone or bone, but very few of them had barbs; and some of them had a round blunt point. What use these are applied to, we cannot say, unless it be to kill small animals without damaging the skin. Their bows were such as we had observed on the American coast: their spontoons, or spears, were of iron or steel, and of European or Asiatic workmanship; and considerable pains had been taken to embellish them with carving, and inlayings of brass, and of a white metal. Those who stood with bows and arrows in their hands, had the spear slung by a leathern strap over their right shoulder. A leathern quiver, slung over their left shoulder served to contain arrows; and some of these quivers were exceedingly beautiful, being made of red leather, on which was very neat embroidery, and other ornaments. Several other things, and particularly their cloathing, indicated a degree of ingenuity far surpassing what any one would expect to find among so northern a people.

The Americans we had seen since our arrival on that coast, had round chubby faces, and high cheek-bones, and were rather low of stature. The people among whom we now were, far from resembling them, had long visages, and were stout and well made: upon the whole, they appeared to be a very different nation. No women, nor children of either sex, were observed, nor any aged persons, except one man, whose head was bald; and he was the only one who bore no arms: the others seemed to be select men, and rather under than above the middle age. The elderly man had a black mark across his face, which was not perceived in any of the others; all of them had their ears perforated, and some had glass beads hanging to them. These

were the only fixed ornaments seen about them, for they wear none to their lips: this is another particular, in which they differ from the Americans we had lately seen. Their apparel consisted of a pair of breeches, a cap, a frock, a pair of boots, and a pair of gloves, all made of the skins of deer, dogs, seals, and other animals, and extremely well dressed; some with the hair or fur on, and others without it. The caps were made in such a manner, as to fit the head very close; and besides these caps, which were worn by most of them, we procured from them some hoods, made of dog-skins, that were sufficiently large to cover both head and shoulders. Their hair was apparently black, but their heads were either shaved, or the hair cut close off, and none of them wore beards. Of the few articles which they obtained from our people, knives and tobacco were what they set the most value upon.

In the village we saw both their winter and their summer habitations; the former are exactly like a vault, the floor of which is sunk below the surface of the earth. One of them, which Captain Cook examined, was of an oval figure, about twenty feet in length, and twelve or more in height; the framing consisted of wood, and the ribs of whales, judiciously disposed, and bound together with smaller materials of the same kind. Over this framing, a covering of strong coarse grafs was laid, and that again was covered with earth; so that on the outside, the house had the appearance of a little hillock, supported by a wall of stone, of the height of three or four feet, which was built round the two sides, and one end. At the other end of the habitation, the earth was raised sloping, to walk up to the entrance, which was by a hole in the top of the roof, over that end. The floor was boarded, and under it was a sort of cellar, in which the Captain saw nothing but water; at the end of each house was a vaulted room, which he supposed was a store-room. These store-rooms communicated, by a dark passage, with the house; and with the open air, by a hole in the roof, which was even with the ground one walked upon; but they cannot be said to be entirely below ground; for one end extended to the edge of the hill, along which they were made, and which was built up with stone. Over it stood a kind of sentry box, or tower, formed of the large bones of great fish. Their summer huts were of a tolerable size, and circular, being brought to a point at the top. Slight poles and bones, covered with the skins of sea-animals, composed the framing. Captain Cook examined the inside of one: there was a fire-place just within the door, where a few wooden vessels were deposited, all very dirty. Their bed-places were close to the side, and occupied about one-half of the circuit: some degree of privacy seemed to be observed; for there were several partitions, made with skins. The bed and bedding consisted of deer-skins, and most of them were clean and dry. About the houses were erected several stages, ten or twelve feet in height, such as we had seen on some parts of the American coast. They were composed entirely of bones, and were apparently intended for drying their fish and skins, which were thus placed out of the reach of their dogs, of which they had great numbers. These dogs are of the fox kind, rather large, and of different colours, with long soft hair, that resembles wool. They are, in all probability, used for the purpose of drawing their sledges in winter; for it appears that they have sledges, as the Captain saw many of them laid up in one of their winter huts. It is, likewise, not improbable, that dogs constitute a part of their food, for several lay dead, which had been killed that morning. The canoes of these people are of the same kind with those of the northern Americans, some, both of the large and small sort, being seen lying in a creek, near the village. From the large bones of fish, and other sea-animals, it appeared, that the sea furnished them with the greater part of their subsistence. The country seemed extremely barren, as our gentlemen saw not a tree or shrub. At some distance towards the west, they observed a ridge of mountains covered with snow, that had fallen not long before.

Some of us at first, supposed this land to be a part of the island of Alaschka, laid down in Mr. Stæhlin's map before mentioned; but from the appearance of the coast, the situation of the opposite shore of America, and from the longitude, we soon conjectured that it was, more probably, the country of the Tschutski, or the eastern extremity of Asia, explored by Beering in the year 1728. In admitting this, however, without farther examination, we must have pronounced Mr. Stæhlin's map, and his account of the new northern Archipelago, to be either remarkably erroneous, even in latitude, or else to be a mere fiction; a judgment which we would not presume to pass, upon a publication so respectably vouched, without producing the most decisive proofs. Our party having remained with these people between two and three hours, they returned on board; and, soon after, the wind becoming southerly, we weighed anchor, stood out of the bay, and steered to the N. E. between the coast and the two islands. At noon, the next day, August 11, the former extended from S. 80 deg. W. to N. 84 deg. W. the latter bore S. 40 deg. W. and the peaked hill, over Cape Prince of Wales, bore S. 36 deg. E. The latitude of the ship was 66 deg. 5 min. N. the longitude 191 deg. 19 min. E. our soundings were 28 fathoms; and our position nearly in the middle of the channel, between the two coasts, each being at the distance of about seven leagues. From this station we steered to the eastward, in order to make a nearer approach to the American coast. In this course the water gradually shoaled; and there being very little wind, and all our endeavours to encrease our depth failing, we were obliged at last to cast anchor in six fathoms; which was the only remedy remaining, to prevent the ships driving into more shallow water. The nearest part of the western land bore W. 12 leagues distant; the peaked mountain over Cape Prince of Wales, bore S. 16 deg. W. and the most northern part of the American continent in sight, E. S. E. the distance of the nearest part being about four leagues. After we had anchored, a boat was dispatched to sound, and the water was found to shoal gradually towards the land. While our ships lay at anchor, which was from six to nine in the evening, we perceived little or no current, nor did we observe that the water rose or fell. A northerly breeze springing up, we weighed, and made sail to the westward, which course soon brought us into deep water; and, during the 12th, we plied to the northward in sight of both coasts, but we kept nearest to that of America. On the 13th, at four in the afternoon, a breeze arising at S. we steered N. E. by N. till four o'clock the next morning, when, seeing no land, we directed our course E. by N. and between the hours of nine and ten, land appeared, which we supposed was a continuation of the continent. It extended from E. by S. to E. by N. and, not long afterwards, we descried more land, bearing N. by E. Coming rather suddenly into 13 fathoms water, at two in the afternoon, we made a trip off till four, when we again stood in for the land; which, soon after, we saw, extending from N. to S. E. the nearest part being at the distance of three or four leagues. The coast here forms a point, named by us Point Mulgrave, which is situated in the latitude of 67 deg. 45 min. N. and in the longitude of 194 deg. 51 min. E. The land seemed to be very low near the sea, but a little farther it rises into hills of a moderate height; the whole was free from snow, and apparently destitute of wood. We now tacked, and bore away N. W. by W. but, in a short time afterwards, thick weather, with rain, coming on, and the wind increas- ing, we hauled more to the westward.

Saturday the 15th, at two o'clock A. M. the wind veered to S. W. by S. and blew a strong gale, which abated towards noon. We now stood to the N. E. till six the next morning, when we steered rather more easterly: in this run, we met with several sea-horses, and great numbers of birds; some of which resembled sand-larks, and others were not larger than hedge-sparrows. We also saw some shags, so that we judged we were not far from land; but, having a thick fog, we could not expect to see any; and as the wind blew strong,

it was not deemed prudent to continue a course which was most likely to bring us to it. From the noon of this day, to six o'clock in the morning of the following, we steered E. by N. a course which brought us into fifteen fathoms water. We now steered N. E. by E. thinking, by such a course, to encrease our depth of water. But in the space of six leagues, it shoaled to 11 fathoms, which induced us to haul close to the wind, that now blew at W. About twelve o'clock, both sun and moon were clearly seen at intervals, and we made some hasty observations for the longitude; which, reduced to noon, when the latitude was 70 deg. 33 min. N. gave 197 deg. 41 min. E. The time-keeper, for the same time, gave 198 deg. In the forenoon, we perceived a brightness in the northern horizon, like that reflected from ice, usually called the blink. Little notice was taken of it, from a supposition that it was improbable we should so soon meet with ice. The sharpness of the air, however, and gloominess of the weather, for the two or three preceding days, seemed to indicate some sudden change. About an hour afterwards, the sight of an enormous mass of ice, left us no longer in any doubt respecting the cause of the brightness of the horizon. Between two and three o'clock, we tacked close to the edge of the ice, in 22 fathoms water, being then in the latitude of 70 deg. 41 min. north, and unable to stand on any farther, for the ice was perfectly impenetrable, and extended from W. by S. to E. by N. as far as the eye could reach. Here we met with great numbers of sea-horses, some of which were in the water, but far more upon the ice. The Commodore had thoughts of hoisting out the boats to kill some of these animals; but, the wind freshening, he gave up the design; and we continued to ply towards the south, or rather towards the west, for the wind came from that quarter. We made no progress; for, at twelve on the 18th, our latitude was 70 deg. 44 min. north, and we were almost five leagues farther to the east. We were, at present, close to the edge of the ice, which was as compact as a wall, and appeared to be at least ten or twelve feet in height; but, farther northward, it seemed to be much higher. Its surface was exceedingly rugged, and, in several places, we saw pools of water upon it. We now stood to the south, and, after running six leagues, shoaled the water to seven fathoms; but it soon increased to the depth of nine fathoms. At this time, the weather, which had been hazy, becoming clearer, we saw land extending from S. to S. E. by E. at the distance of three or four miles. The eastern extremity forms a point, which was greatly encumbered with ice, on which account it was distinguished by the name of Icy Cape. Its latitude is 70 deg. 29 min. north, and its longitude 198 deg. 20 min. east. The other extreme of the land was lost in the horizon; and we had no doubt of its being a continuation of the continent of America. The Discovery being about a mile astern, and to leeward, met with less depth of water than we did; and tacking on that account, the Commodore was obliged to tack also, to prevent separation. Our present situation was very critical. We were upon a lee-shore in shoal water; and the main body of the ice to windward, was driving down upon us. It was evident, that if we continued much longer between it and the land, it would force us ashore, unless it should chance to take the ground before us. It appeared almost to join the land to leeward, and the only direction that was free from it was to the south westward. After making a short board to the north, Captain Cook made a signal for the Discovery to tack, and his ship tacked at the same time. The wind proved in some measure favourable, so that we lay up S. W. and S. W. by W.

Wednesday the 19th at eight in the morning, the wind veering to west, we tacked to the northward; and, at twelve, the latitude was 70 deg. 6 min. north, and the longitude 196 deg. 42 min. east. In this situation, we had a considerable quantity of drift ice about our ships, and the main ice was about two leagues to the north. Between one and two, we got in with the edge of it. It was less compact than that which we had observed to- wards

THE WHALING SHIP, CAPT. W. J. WILSON, 1840. BY J. T. WILSON, N.Y.

wards the north; but it was too close, and in too large pieces to attempt forcing the ships through it. We saw an amazing number of sea-horses on the ice, and as we were in want of fresh provisions, the boats from each ship were dispatched to procure some of them. By seven in the evening, we had received, on board the *Resolution*, nine of these animals; which, till this time, we had supposed to be sea-cows; so that we were greatly disappointed, particularly some of the sailors, who, on account of the novelty of the thing, had been feasting their eyes for some days past. Nor would they now have been disappointed, nor have known the difference, if there had not been two or three men on board, who had been in Greenland, and declared what animals these were, and that no person ever eat of them. Notwithstanding this, we made them serve us for provisions, and there were few of our people who did not prefer them to our salt meat. The fat of these animals is, at first, as sweet as marrow; but, in a few days, it becomes rancid, unless it is salted, in which state it will keep much longer. The lean flesh is coarse and blackish, and has a strong taste; but the heart is almost as well tasted as that of a bullock. The fat, when melted, affords a good quantity of oil, which burns very well in lamps; and their hides, which are of great thickness, were extremely useful about our rigging. The teeth, or tusks, of most of them were, at this time, of a very small size; even some of the largest and oldest of these animals, had them not exceeding half a foot in length. Hence we concluded, that they had lately shed their old teeth. They lie upon the ice in herds of many hundreds, huddling like swine, one over the other; and they roar very loud; so that in the night, or when the weather was foggy, they gave us notice of the vicinity of the ice, before we could discern it. We never found the whole herd sleeping, some of them being constantly upon the watch. These, on the approach of the boat would awake those that were next to them; and the alarm being thus gradually communicated, the whole herd would presently be awake. However, they were seldom in a hurry to get away, before they had been once fired at. Then they would fall into the sea, one over the other in the utmost confusion; and, if we did not happen, at the first discharge, to kill those we fired at, we generally lost them, though mortally wounded. They did not appear to us to be so dangerous as some authors have represented them, not even when they were attacked. They are, indeed, more so, in appearance, than in reality. Vast multitudes of them would follow, and come close up to the boats; but the flash of a musket in the pan, or even the mere pointing of one at them, would send them down in a moment. The female will defend her young one to the very last, and at the expence of her own life, whether upon the ice or in the water. Nor will the young one quit the dam, though she should have been killed; so that, if you destroy one, you are sure of the other. The dam, when in the water, holds her young one between her fore fins. Mr. Pennant, in his *Synopsis of Quadrupeds*, has given a very good description of this animal under the name of the Arctic Walrus. Why it should be called a sea-horse, is difficult to determine, unless the word be a corruption of the Russian name *Morse*; for they do not in the least resemble a horse. It is, doubtless, the same animal that is found in the Gulph of St. Lawrence, and there called a sea-cow. It is certainly more like a cow than a horse; but this resemblance consists in nothing but the snout. In short, it is an animal not unlike a seal, but incomparably larger. The length of one of them, which was none of the largest, was nine feet four inches from the snout to the tail; the circumference of its body at the shoulder, was seven feet ten inches; its circumference near the hinder fins was five feet six inches, and the weight of the carcass, without the head, skin, or entrails, was eight hundred and fifty-four pounds. The head weighed forty-one pounds and a half, and the skin two hundred and five pounds. It may not be improper to remark, that, for some days before this time, we had often seen flocks of ducks flying to the south. They were of two species, the one much larger than the other. The larger

sort was of a brown colour; and of the small sort, either the duck or drake was black and white, and the other brown. Some of our people said that they also saw geese. This seems to indicate, that there must be land to the northward, where these birds, in the proper season, find shelter for breeding, and whence they were now on their return to a warmer climate.

After we had got our sea-horses on board, we were, in a manner, surrounded with the ice; and had no means of clearing it, but by steering to the southward, which we did till three o'clock the next morning, with a light westerly breeze, and, in general, thick, foggy weather. Our soundings were from 12 to 15 fathoms. We then tacked and stood to the northward till ten o'clock, when the wind shifting to the N. we stood to the W. S. W. and W. At two in the afternoon, we fell in with the main ice, and kept along the edge of it, being partly directed by the roaring of the sea-horses, for we had an exceeding thick fog. Thus we continued sailing till near midnight, when we got in among the loose pieces of ice. The wind being easterly, and the fog very thick, we now hauled to the southward; and, at ten the next morning, the weather clearing up, we saw the American continent, extending from S. by E. to E. by S. and, at noon, from S. W. half S. to E. the distance of the nearest part being five leagues. We were at present in the latitude of 69 deg. 32 min. N. and in the longitude of 195 deg. 48 min. E. and, as the main ice was not far from us, it is evident, that it now covered a part of the sea; which, a few days before, had been free from it; and that it extended farther towards the S. than where we first fell in with it. During the afternoon we had but little wind; and the master was sent in a boat to observe whether there was any current, but he found none. We continued to steer for the American land till eight o'clock, in order to obtain a nearer view of it, and to search for a harbour; but seeing nothing that had the appearance of one, we again stood to the N. with a gentle westerly breeze. At this time, the coast extended from S. W. to E. the nearest part being at the distance of four or five leagues. The southern extreme seemed to form a point, to which the name of Cape Lisburne was given. It is situate in the latitude of 69 deg. 5 min. N. and in the longitude of 194 deg. 42 min. E. and appeared to be tolerably high land, even down to the sea; but there may be low land under it, which we might not then see, being not less than ten leagues distant from it. In almost every other part, as we advanced to the north, we had found a low coast, from which the land rises to a moderate height. The coast now before us was free from snow, except in one or two places, and had a greenish hue. But we could not discern any wood upon it.

Saturday the 22d, the wind was southerly, and the weather for the most part foggy, with some intervals of sunshine. At eight in the evening, we had a calm, which continued till midnight, when we heard the surge of the sea dashing against the ice, and had many loose pieces about us. A light piece now arose at N. E. and the fog being very thick, we steered to the S. to get clear of the ice. At eight the next morning, the fog dispersed, and we hauled towards the W. for the Commodore finding we could not get to the N. near the coast, by reason of the ice, resolved to try what could be done at a distance from it; and as the wind seemed to be fixed at N. he considered it as a favourable opportunity. In our progress to the westward, the water gradually deepened to 28 fathoms. With the northerly wind the air was sharp and cold; and we had fogs, sunshine, showers of snow and sleet alternately. On the 26th, at ten in the morning, we fell in with the ice. At twelve, it extended from N. W. to E. by N. and seemed to be thick and compact. We were now, by observation, in the latitude of 69 deg. 36 min. N. and in the longitude of 184 deg. E. and it appeared that we had no better prospect of getting to the N. here, than nearer the shore. We continued steering to the W. till five in the afternoon, when we were, in some degree, embayed by the ice, which was very close in the

N. W. and N. E. quarters, with a great quantity of loose ice about the edge of the main body. At this time, we had baffling light airs, but the wind soon settled at S. and increased to a fresh gale, accompanied with showers of rain. We got the tack aboard, and stretched to the E. as this was the only direction in which the sea was free from ice.

Thursday the 27th, at four o'clock, A. M. we tacked and stood to the westward, and at seven o'clock in the evening, we were close in with the edge of the ice, which lay E. N. E. and W. S. W. as far in each of those directions as the eye could reach. There being but little wind, Captain Cook went with the boats, to examine the state of the ice. He found it consisting of loose pieces, of various extent, and so close together, that he could scarcely enter the outer edge with a boat; and it was as impracticable for the ships to enter it, as if it had been so many rocks. He particularly remarked, that it was all pure transparent ice, except the upper surface, which was rather porous. It seemed to be wholly composed of frozen snow, and to have been all formed at sea. For, not to insist on the improbability of such prodigious masses floating out of rivers, none of the productions of the land were found incorporated, or mixed with it; which would certainly have been the case, if it had been formed in rivers, either great or small. The pieces of ice that formed the outer edge of the main body, were from forty to fifty yards in extent, to four or five; and the Captain judged, that the larger pieces reached thirty feet or more, under the surface of the water. He also thought it highly improbable, that this ice could have been the production of the preceding winter alone. He was rather inclined to suppose it to have been the production of many winters. It was equally improbable, in his opinion, that the little that now remained of the summer, could destroy even the tenth part of what now subsisted of this great mass; for the sun had already exerted upon it the full force and influence of his rays. The sun, indeed, according to his judgment, contributes very little towards reducing the enormous masses. For though that luminary is above the horizon a considerable while, it seldom shines out for more than a few hours at a time, and frequently is not seen for several successive days. It is the wind, or rather the waves raised by the wind, that brings down the bulk of these prodigious masses, by grinding one piece against another, and by undermining and washing away those parts which are exposed to the surge of the sea. This was manifest, from the Captain's observing, that the upper surface of many pieces had been partly washed away, while the base, or under part, continued firm for several fathoms round that which appeared above water, like a shoal round a high rock. He measured the depth of water upon one, and found that it was 15 feet, so that the ships might have sailed over it. If he had not measured this depth, he would have been unwilling to believe, that there was a sufficient weight of ice above the surface, to have sunk the other so much below it. It may thus happen, that more ice is destroyed in one tempestuous season, than is formed in several winters, and an endless accumulation of it is prevented. But that there is constantly a remaining store, will be acknowledged by every one who has been upon the spot. A thick fog, which came on while the Commodore was thus employed with the boats, hastened him aboard sooner than he could have wished, with one sea-horse to each ship. Our party had killed many, but could not wait to bring them off. The number of these animals, on all the ice that we had seen, is really astonishing. We spent the night standing off and on, among the drift ice, and at nine o'clock the next morning, the fog having in some degree dispersed, boats from each of the ships were dispatched for sea-horses; for our people by this time began to relish them, and those we had before furnished ourselves with, were all consumed. At noon, our latitude was 69 deg. 17 min. N. our longitude 183 deg. E. and our depth of water was 25 fathoms. At two in the afternoon, having got on board as many sea-horses as were deemed sufficient, and the

wind freshening at S. S. E. we hoisted in the boats, and steered to the S. W. But being unable to weather the ice upon this tack, or to go through it, we made a board to the eastward, till about eight o'clock, then resumed our course to the S. W. and were obliged before midnight to tack again, on account of the ice. Not long after, the wind veering to the N. W. and blowing a stiff gale, we stretched to the S. W. close hauled.

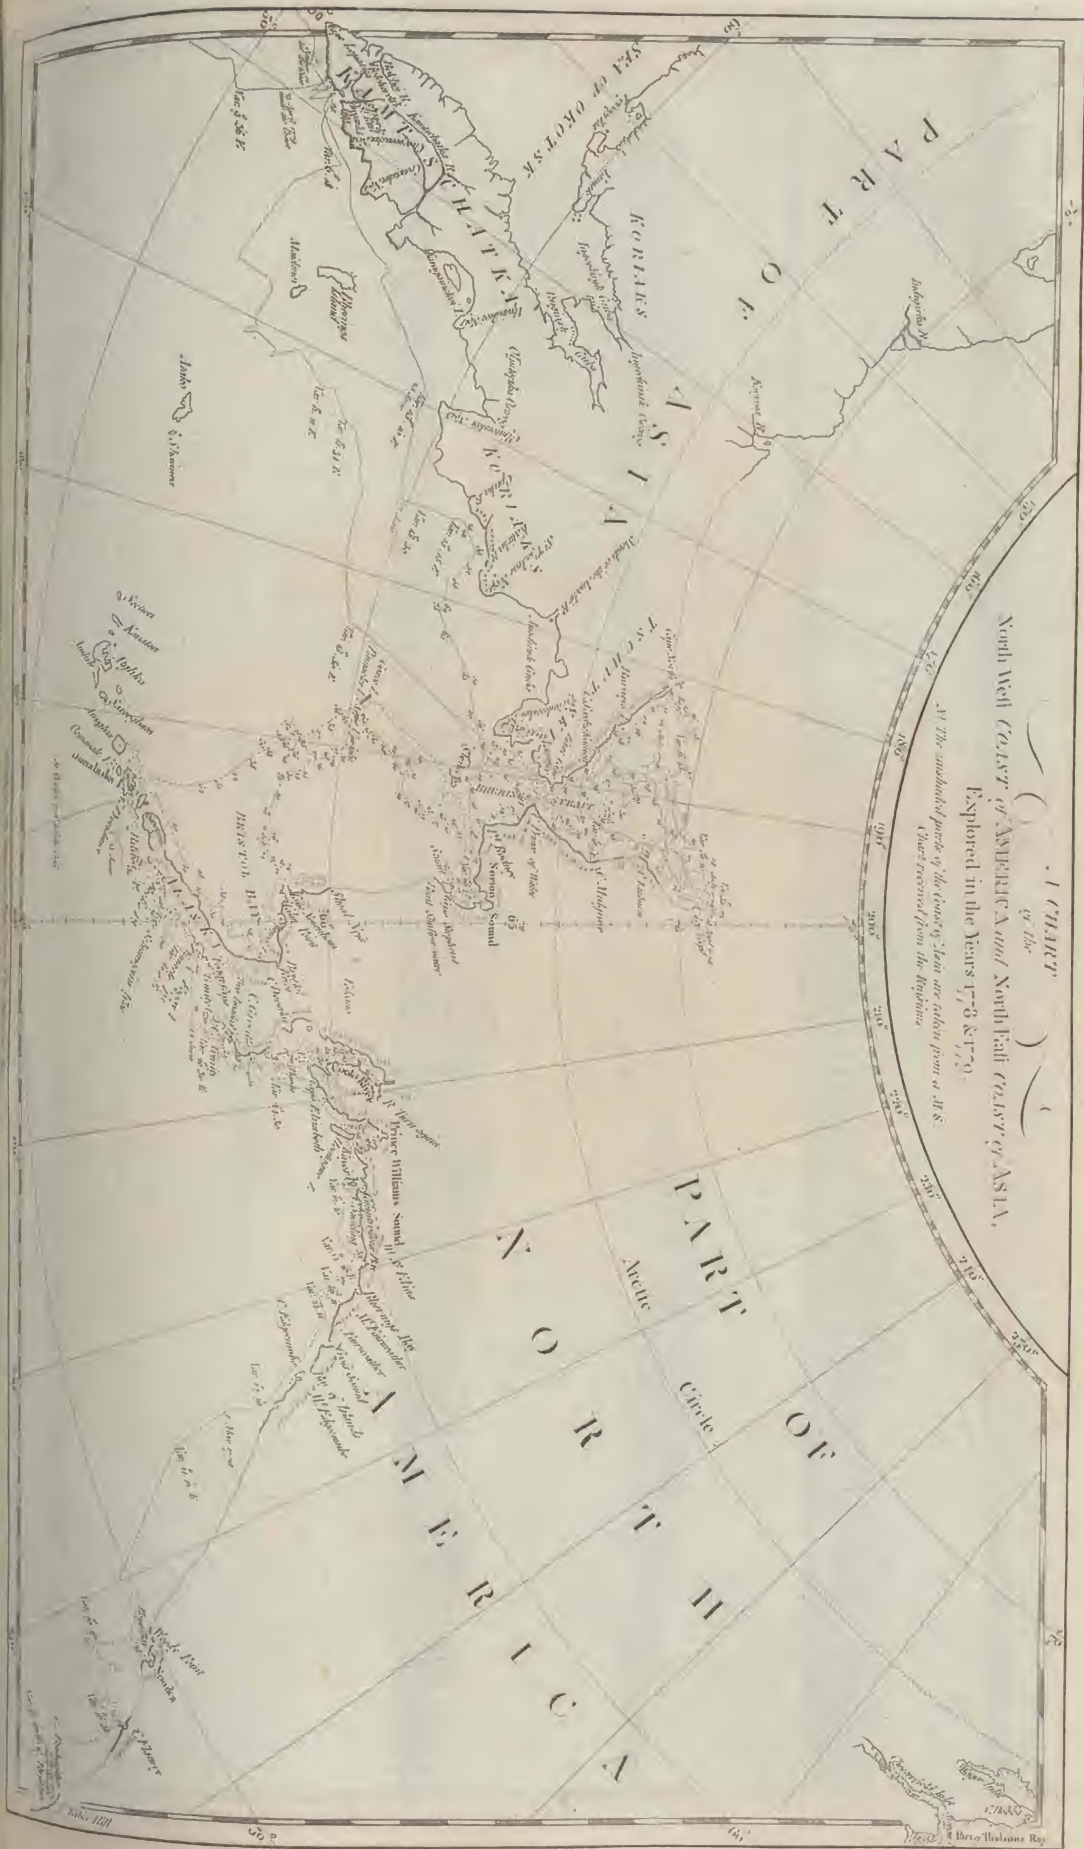

Friday the 29th, in the morning, we saw the main ice towards the N. and soon after, perceived land bearing S. W. by W. In a short time after this, more land was seen, bearing W. It shewed itself in two hills, resembling islands, but soon the whole appeared connected. As we made a nearer approach to the land, the depth of water decreased very fast, so that, at twelve o'clock, when we tacked, we found only eight fathoms; being three miles from the coast, which extended from S. 30 deg. E. to N. 60 deg. W. the latter extremity terminating in a bluff point, being one of the hills mentioned before. The weather was now very hazy, with drizzling rain; but, soon afterwards, it cleared up, particularly to the southward, westward, and northward. This enabled us to have a tolerable view of the coast, which resembles, in every respect, the opposite coast of America; that is, low land next the sea, with higher land farther back. It was totally destitute of wood, and even of snow; but was, probably, covered with a mossy substance, that gave it a brownish hue. In the low ground that lay between the sea and the high land, was a lake, extending to the south eastward farther than we could see. As we stood off, the most westerly of the two hills above-mentioned, came open off the bluff point, in a N. W. direction. It had the appearance of an island, but it might perhaps be connected with the other by low land, though we did not see it. And if that be the case, there is a two-fold point, with a bay between them. This point, which is rocky and steep, received the name of Cape North. It is situated nearly in the latitude of 68 deg. 56 min. N. and in the longitude of 180 deg. 51 min. E. The coast beyond it doubtless assumes a very westerly direction; for we could discern no land to the northward of it, though the horizon was there pretty clear. Wilfuling to see more of the coast to the westward, we tacked again, at two in the afternoon, thinking we should be able to weather Cape North; but finding we could not, the wind freshening, a thick fog arising, with much snow, and being apprehensive of the ice coming down upon us, the Commodore relinquished the design he had formed of plying to the westward, and again stood off shore. The season was now so far advanced, and the time when the frost generally sets in was so near, that Captain Cook did not think it consistent with prudence, to make any farther attempts to discover a passage into the Atlantic Ocean this year, in any direction, so small was the probability of success. His attention was now directed to the search of some place, where we might recruit our wood and water; and the object that principally occupied his thoughts was, how he should pass the winter, so as to make some improvements in navigation and geography, and, at the same time, be in a condition to return to the northward the ensuing summer, to prosecute his search of a passage into the Atlantic. Having stood off till our soundings were eighteen fathoms, we made fail to the eastward, along the coast, which, we were now pretty well convinced could only be the continent of Asia. The wind blowing fresh, and there being, at the same time, a thick mist, and a very heavy fall of snow, it was requisite that we should proceed with particular caution: we therefore brought to, for a few hours, in the night. Early the next morning, the 30th, we steered such a course as we judged most likely to bring us in with the land, being guided, in a great measure, by the land; for the weather was extremely thick and gloomy, with incessant showers of snow. At ten o'clock we obtained a sight of the coast, which was at the distance of four miles, bearing S. W. Soon afterwards, our depth of water having decreased to seven fathoms, we hauled off. A very low point now bore S. S. W. distant two or three miles; to the eastward of which

London: Published as the property of the Admiralty, by their Order, at the Admiralty, 1804.

which there seemed to be a narrow channel, that led into some water which we saw over the point. It is not improbable, that the lake above-mentioned communicates here with the sea. At noon, the mist dispersing, we had a view of the coast, which extended from S. E. to N. W. by W. Some parts of it were apparently higher than others; but the greatest part of it was rather low, with high land farther up the country. It was almost entirely covered with snow, which had fallen very lately. We ranged along the coast, at the distance of about two leagues, till ten o'clock in the evening, when we hauled off; but resumed our course early on the following morning, when we had another view of the coast, extending from W. to S. E. by S. At eight o'clock the eastern part bore S. and was found to be an island, which at twelve was four or five miles distant, bearing S. W. half S. It is of a moderate height, between four and five miles in circumference, with a steep rocky coast. It is situate in the lat. of 67 deg. 45 min. N. about three leagues from the continent; and is distinguished in the chart by the appellation of Burney's Island. The inland country about this part abounds with hills, some of which are of considerable elevation. The land in general was covered with snow, except a few spots on the coast, which still continued to be low, but somewhat less so than farther towards the W. During the two preceding days, the mean height of the mercury in the thermometer had been frequently below the freezing point, and in general, very little above it; inasmuch that the water in the vessels upon deck, was often covered with a sheet of ice. We continued to steer S. S. E. almost in the direction of the coast, till five o'clock in the afternoon, when we saw land bearing S. 50 deg. E. which proved to be a continuation of the coast. We hauled up for it without delay; and at ten in the evening, being a-breadth of the eastern land, and doubtful of weathering it, we tacked, and made a board towards the W. till after one o'clock the next morning.

Tuesday, the 1st of September, we again made sail to the E. The wind was now very unsettled, continually varying from N. to N. E. Between eight and nine, the eastern extremity of the land was at the distance of six or seven miles, bearing S. by E. A head-land appeared at the same time, bearing E. by S. half S. and not long after, we could discern the whole coast that lay between them, and a little island at some distance from it. The coast now in sight seemed to form several rocky points, that were connected by a low shore, without any appearance of an harbour. At a distance from the sea, many hills presented themselves to our view, the highest of which were involved in snow; in other respects, the whole country had a naked aspect. At seven o'clock in the evening, two points of land beyond the eastern head, opened off it in the direction of S. 37 deg. E. Captain Cook was now convinced of what he had before imagined, that this was the country of the Tschutski, or the north-eastern coast of Asia; and that Beering had proceeded thus far in the year 1728; that is, to this head, which, according to Muller, is denominated Serdze Kamen, on account of a rock upon it, that is of the figure of a heart. There are indeed many high rocks on this cape, some one or other of which may perhaps be shaped like a heart. It is a promontory of tolerable height, with a steep rocky cliff fronting the sea. Its lat. is 67 deg. 3 min. N. and its long. 188 deg. 11 min. E. To the E. of it the coast is elevated and cold; but to the W. it is low, and extends N. W. by W. and N. N. W. and it is nearly of the same direction all the way to Cape North. The depth of water is every where the same at an equal distance from the shore; and this is likewise the case on the opposite coast of America. The greatest depth we met with, as we ranged along it, was 23 fathoms. During the night, or in thick foggy weather, the soundings are no bad guide to those who sail along either of these coasts. On the 2d, at eight in the morning, the most advanced land to the south-eastward, bore S. 25 deg. E. and, from this particular

point of view, had an insular appearance. But the thick showers of snow that fell in quick succession, and settled on the land, concealed from our sight at this time a great part of the coast. In a short time after, the sun, which we had not seen for near five days, broke out during the intervals between the showers, by which means the coast was in some degree freed from the fog, so that we obtained a sight of it, and found that the whole was connected. The wind was still northerly, the air was cold, and the mercury in the thermometer did not rise above 35 deg. and was sometimes not higher than 30 deg. At 12 o'clock our lat. was 66 deg. 37 min. N. Cape Serdze Kamen was 12 or 13 leagues distant, bearing N. 52 deg. W. the most southerly point of land that we had in our sight, bore S. 41 deg. E. our soundings were 22 fathoms; and the distance of the nearest part of the shore was about two leagues. The weather was now fair and bright; and as we were ranging along the coast, we saw several of the natives and some of their dwelling-places, which had the appearance of hillocks of earth. In the course of the evening we passed the Eastern Cape, or the point before-mentioned; from which the coast trends to the south-westward. This is the same point of land that we had passed on the 11th of the preceding month. Those who gave credit to Mr. Stæhlin's map, then supposed it to be the eastern point of his island Alaschka; but we were by this time convinced, that it is no other than the eastern promontory of Asia; and perhaps it is the upper Tschukotkoi Nofs, though the promontory which received that name from Beering, is situated further towards the S. W. Muller, in his map of the discoveries of the Russians, places the Tschukotkoi Nofs nearly in the lat. of 75 deg. N. and extends it somewhat to the eastward of this cape. But Captain Cook was of opinion, that he had no good authority for so doing. Indeed his own, or rather Deshneff's, account of the distance between the river Anadir and the Nofs, cannot well be reconciled with so northerly a position. For he says, that with the most favourable wind, a person may go by sea from the Nofs to the river Anadir in three whole days, and that the journey by land is very little longer. But Captain Cook, having hopes of visiting these parts again, deferred the discussion of this point to another opportunity. In the mean time, however, he concluded, as Beering had done before him, that this was the easternmost point of all Asia. It is a peninsula of considerable elevation, joined to the continent by a very low and apparently narrow isthmus. It has next the sea, a steep rocky cliff, and off the very point are several rocks resembling spires. It stands in the long. of 190 deg. 22 min. E. and in the lat. of 66 deg. 6 min. N. and is 13 leagues distant, in the direction of N. 53 deg. W. from Cape Prince of Wales, on the coast of America. The land about this promontory consists of valleys and hills. The former terminate at the sea in low shores, and the latter in steep rocky points. The hills appeared like naked rocks; but the valleys, though destitute of tree or shrub, were of a greenish hue. Having passed the Cape, we steered S. W. half W. towards the northern point of St. Lawrence's Bay, in which our ships had anchored on the 10th of August. We reached it by eight o'clock the following morning, and saw some of the natives at the place where we had before seen them, as well as others on the opposite side of the bay. Not one of them, however, came off to us, which was rather remarkable, as the weather was sufficiently favourable, and as those whom we had lately visited had no reason to be displeased with us. These people are certainly the Tschutski, whom the Russians had not hitherto subdued; though it is manifest that they must carry on a traffic with the latter, either directly, or by the interposition of some neighbouring nation; as their being in possession of the iponpoons we saw among them, cannot otherwise be accounted for. The Bay of St. Lawrence is, at the entrance, at least five leagues in breadth, and about four leagues deep, growing narrower towards the bottom, where it seemed to be pretty well sheltered from the sea winds, provided there

there is a competent depth of water for ships. The Commodore did not wait to examine it, though he was extremely desirous of finding a convenient harbour in those parts, to which he might resort in the succeeding spring. But he wished to meet with one where wood might be obtained, and he knew that none could be found here. From the southern point of this bay, which is situated in the lat. of 65 deg. 30 min. N. the coast trends W. by S. for the space of about nine leagues, and there seems to form a deep bay or river; or else the land in that part is so low that we could not discern it. In the afternoon, about one o'clock, we saw what was first supposed to be a rock, but it was found to be a dead whale, which some Asiatics had killed, and were then towing ashore. They seemed to endeavour to conceal themselves behind the fish, in order to avoid being seen by us. This, however, was unnecessary, for we proceeded on our course without taking notice of them. On the 4th, at break of day, we hauled to the north-westward, for the purpose of gaining a nearer view of the inlet seen the day before; but the wind, not long after, veering to that direction, the design was abandoned; and steering towards the S. along the coast, we passed two bays, each about six miles deep. The most northerly one is situate before a hill, which is rounder than any other we had observed upon the coast. There is an island lying before the other bay. It is a matter of doubt whether there is a sufficient depth of water for ships in either of these bays, as when we edged in for the shore, we constantly met with shoal water. This part of the country is extremely naked and hilly. In several places on the lower grounds, next the sea, were the habitations of the natives, near all of which were erected stages of bones, like those before-mentioned. This day, at noon, our lat. was 64 deg. 38 min. N. and our long. 188 deg. 15 min. E. the nearest part of the shore was at the distance of three or four leagues; and the most southern point of the continent in sight, bore S. 48 deg. W. By this time the wind had veered to the N. and blew a light breeze; the weather was clear, and the air sharp. The Commodore did not think proper to follow the direction of the coast, as he perceived that it inclined westward towards the gulph of Anadir, into which he had no motive for going. He therefore steered a southerly course, that he might have a sight of the isle of St. Lawrence, which had been discovered by Beering. This island was quickly seen by us, and at eight in the evening it bore S. 20 deg. E. supposed to be at the distance of 11 leagues. The most southerly point of the main land was at that time 12 leagues distant, bearing S. 83 deg. W. Captain Cook conjectured, that this was the point which is called by Beering the eastern point of Suchotki, or Cape Tschukotkoi; an appellation which he gave it with some propriety, because the natives, who said they were of the nation of the Tschutki, came off to him from this part of the coast. Its lat. is 64 deg. 13 min. N. and its long. 186 deg. 36 min. E. The more the Captain was convinced of his being at present upon the Asiatic coast, the more he was at a loss to reconcile his observations with Mr. Stahlin's map of the New Northern Archipelago; and he could find no other method of accounting for so important a difference, than by supposing that he had mistaken some part of what Mr. Stahlin denominates the island of Alaschka for the continent of America, and had missed the channel by which they are separated. But even on that supposition there would still have been a considerable variation. The Captain considered it as an affair of some consequence to clear up this point during the present season, that he might have only one object in view in the following one. And as these northerly islands were said to abound with wood, he had some hopes if he should find them, of procuring a competent supply of that article, of which we began to stand in great need. With this view he steered over for the coast of America; and the next day, about five o'clock in the afternoon, land was seen bearing S. three quarters E. which we imagined was Anderson's

Island, or some other land near it. On Sunday, the 6th, at four in the morning, we had a sight of the American coast, near Sledge Island; and at six in the evening of the same day, that island was at the distance of about ten leagues, bearing N. 6 deg. E. and the most easterly land in view bore N. 49 deg. E. If any part of what Captain Cook had conjectured to be the coast of the American continent, could possibly be the island of Alaschka, it was that now in sight; in which case he must have missed the channel between it and the main land, by steering towards the W. instead of the E. after he had first fallen in with it. He was, therefore, at no loss where to go, for the purpose of clearing up these doubts. On the 7th, at eight o'clock in the evening, we had made a near approach to the land. Sledge Island bore N. 85 deg. W. about eight leagues distant; and the eastern part of the coast bore N. 70 deg. E. with elevated land in the direction of E. N. At this time we perceived a light on shore, and two canoes with people in them, came off towards us. We brought to, in order to give them time to approach; but they resisted all our tokens of amity, and kept at the distance of a quarter of a mile. We therefore left them, and proceeded along the coast. The next morning, at one o'clock, observing that the water shoaled pretty fast, we anchored in ten fathoms, and remained in that situation till day-light came on. We then weighed, and pursued our course along the coast, which trended E. and E. half S. At seven o'clock in the evening we were abreast of a point, situated in the long. of 197 deg. E. and in the lat. of 64 deg. 21 min. N. beyond which the coast assumes a more northerly direction. At eight this point, which received the appellation of Cape Darby, bore S. 62 deg. W. the most northern land we had in view, bore N. 32 deg. E. and the distance of the nearest part of the shore was one league. In this situation we let go our anchors in thirteen fathoms, over a muddy bottom.

On Wednesday the 9th, at break of day, we weighed, and made sail along the coast. We now saw land, which we supposed to be two islands; the one bearing E. the other S. 70 deg. E. Not long afterwards, we found ourselves near a coast covered with wood; a pleasing sight, to which we had not been lately accustomed. As we advanced northward, land was seen in the direction of N. E. half N. which proved a continuation of the coast, upon which we now were: we likewise perceived high land over the islands, apparently, at a considerable distance beyond them. This was imagined to be the continent, and the other land the isle of Alaschka; but it was already a matter of doubt, whether we should discover a passage between them, for the water gradually shoaled, as we proceeded further towards the N. In consequence of this, two boats were dispatched a-head to sound; and the Commodore ordered the Discovery, as she drew the least water, to lead, keeping nearly in the middle channel, between the coast and the most northerly island. In this manner we continued our course, till three o'clock in the afternoon, when, having passed the island, our soundings did not exceed three fathoms and a half, and the Resolution once brought the mud up from the bottom. In no part of the channel could a greater depth of water be found, though we had sounded it from one side to the other; we therefore deemed it high time to return.

At this time a head-land on the western shore, to which the name of Bald-head was given, was about one league distant, bearing N. by W. The coast extended beyond it as far as N. E. by N. where it appeared to terminate in a point; behind which the coast of the high land that was seen over the islands stretched itself. The shore on the western side of Bald-head, forms a bay, in the bottom of which is a beach, where we perceived many huts of the natives. We continued to ply back during the whole night, and by day-break on the 10th had deepened our water six fathoms. At nine o'clock, when we were about three miles from the W. shore, Captain Cook, accompanied by Mr. King, went with two boats in search of wood and water. They landed in that part, where the coast projects into a bluff head,

head, composed of perpendicular strata of a dark blue rock, intermixed with glimmer and quartz. Adjoining to the beach is a narrow border of land, which was at this time covered with long grass, and where they observed some angelica. The ground beyond this, rises with some abruptness; towards the top of this elevation they found a heath, that abounded with berries of various kinds: further onward the country was rather level, and thinly covered with small spruce trees, birch, and willows. They saw the tracks of foxes and deer upon the beach, in many parts of which, there was a great abundance of drift-wood: there was also no want of fresh water. Our gentlemen and their attendants having returned on board, the Commodore had thoughts of bringing the ships to an anchor here; but the wind then shifting to N. E. and blowing rather on this shore, he stretched over to the opposite one, expecting to find wood there likewise. At eight in the evening, we anchored near the southern end of the most northerly island, for such we then imagined it to be. The next morning, however, we found that it was a peninsula, connected with the continent by a low isthmus, on each side of which a bay is formed by the coast. We plied into the southernmost of these bays, and cast anchor again about twelve o'clock, in five fathoms water, over a muddy bottom; the point of the peninsula, to which the name of Cape Denbigh was given, being one league distant, in the direction of N. 68 deg. W. We observed on the peninsula, several of the natives, and one of them came off in a small canoe. Captain Cook gave this man a knife and some beads, with which he appeared to be well pleased; we made signs to him to bring us some provisions, upon which he instantly quit us, and paddled towards the shore. Happening to meet another man coming off, who had two dried salmon, he got them from him; and when he returned to our ship he refused to give them to any body except Captain Cook. Some of our people fancied, that he asked for him under the name of Capitane; but in this they were perhaps mistaken. Others of the inhabitants came off soon afterwards, and gave us a few dried fish, in exchange for such trifles as we had to barter with them. They shewed no dislike for tobacco, but they were most desirous of knives. In the afternoon, Mr. Gore was dispatched to the peninsula, to procure wood and water; of the former of which articles we observed great plenty upon the beach. At the same time a boat from each of the ships was sent to found round the bay; and at three o'clock, the wind freshening at N. E. we weighed anchor, and endeavoured to work further in, but that was quickly found to be impracticable, by reason of the shoals which extended entirely round the bay, to the distance of upwards of two miles from the shore, as the officers who had been sent out for the purpose of founding reported. We therefore stood off and on with the ships, waiting for Lieutenant Gore, who returned about eight o'clock in the evening, with the launch loaded with wood. He informed the Commodore, that he had found but little fresh-water, and that the wood could not be procured without difficulty, on account of the boats grounding at some distance from the beach. As this was the case, we stood back to the other shore, and the next morning at eight, all the boats and a detachment of men with an officer, were sent to get wood from the place where Captain Cook had landed on the 10th. After having continued for some time to stand off and on with the ships, we at length cast anchor in less than five fathoms, at the distance of half a league from the coast, whose southern point bore S. 26 deg. W. Cape Denbigh was about 26 miles distant, bearing S. 72 deg. E. Bald-head was nine leagues off, in the direction of N. 60 deg. E. and the island near the eastern shore, S. of Cape Denbigh, named by Captain Cook, Beiborough Island, was 15 leagues distant, bearing S. 52 deg. E. This being a very open road, and therefore not a secure station for the ships, the Commodore resolved not to wait till our stock of water was completed, as that would take up some time; but only to furnish both ships with wood, and afterwards to seek

No. 69.

a more commodious place for the former article. Our people carried off the drift-wood that lay on the beach, and performed that business with great expedition; for, as the wind blew along the shore, the boats were enabled to sail both ways. In the afternoon Captain Cook went on shore, and took a walk into the country, which in those parts where there was no wood, abounded with heath, and other plants, several of which had plenty of berries, all ripe. Scarce a single plant was in flower. The underwood, such as birch, alders, and willows, occasioned walking to be very troublesome among the trees, which were all spruce, and none of which exceeded seven or eight inches in diameter; but some were observed lying on the beach, that were above twice that size. All the drift-wood that we saw in these northern parts was fir.

Sunday the 13th, a family of the natives came near the spot where our people were occupied in taking off wood. The Captain saw only the husband and wife, and their child, besides a fourth person, who was the most deformed cripple he had ever seen. The husband was nearly blind, and neither he, nor his wife, were such well-looking people as many of those whom we had met with on this coast. Both of them had their lower lips perforated; and they were in possession of some glass-beads, resembling those we had seen before among their neighbours. Iron was the article that pleased them most. For four knives which had been formed out of an old iron-hoop, the Captain obtained from them near four hundred pounds weight of fish, that had been lately caught by them. Some of these were trout, and others were, with respect to size and taste, somewhat between a herring and a mullet. The Captain gave a few beads to the child, who was a female; upon which the mother immediately burst into tears, then the father, next after him the cripple, and at last, to add the finishing stroke to the concert, the child herself. This music, however, was not of long duration. Mr. King had on the preceding day been in company with the same family. His account of this interview is to the following purport: While he attended the wooing party, a canoe filled with natives approached, out of which an elderly man and woman (the husband and wife above-mentioned) came ashore. Mr. King presented a small knife to the woman, and promised to give her a much larger one in exchange for some fish. She made signs to him to follow her. After he had proceeded with them about a mile, the man fell down as he was crossing a stony beach, and happened to cut his foot very much. This occasioned Mr. King to stop; upon which the woman pointed to her husband's eyes, which were covered with a thick whitish film. He afterwards kept close to his wife, who took care to apprise him of the obstacles in his way. The woman had a child on her back, wrapped up in the hood of her jacket. After walking about two miles, they arrived at an open skin-boat, which was turned on one side, the convex part towards the wind, and was made to serve for the habitation of this family. Mr. King now performed a remarkable operation on the man's eyes. He was first desired to hold his breath, then to breathe on the distempered eyes, and afterwards to spit on them. The woman then took both the hands of Mr. King, and pressing them to the man's stomach, held them there for some time, while she recounted some melancholy history respecting her family; sometimes pointing to her husband, sometimes to her child, and at other times to the cripple, who was related to her. Mr. King purchased all the fish they had, which consisted of excellent salmon, salmon-trout, and mullet. These fish were faithfully delivered to the person he sent for them. The woman was short and squat, and her visage was plump and round. She wore a jacket made of deer skin, with a large hood, and had on a pair of wide boots. She was punctured from the lip to the chin. Her husband was well made, and about five feet two inches in height. His hair was black and short, and he had but little beard. His complexion was of a light copper cast. He had two holes in his lower lip, in which, however, he had no ornaments. The teeth of both of them were black,

black, and appeared as if they had been filed down level with the gums.

Before night, on Sunday the 13th, we had amply furnished the ships with wood, and had conveyed on board about a dozen tons of water to each. On the 14th a party was detached on shore to cut brooms, and likewise the branches of spruce-trees for brewing beer. About twelve o'clock all our people were taken on board, for the wind freshening had raised so heavy a surf on the beach, that our boats could not continue to land without extreme difficulty and danger. As doubts were still entertained whether the coast, upon which we now were, belonged to an island, or to the continent of America, lieutenant King was dispatched by the Commodore, with two boats, well manned and armed, to make such a search as might tend to remove all difference of opinion on the subject. He was instructed to proceed towards the north as far as the extreme point seen on Wednesday the 9th, or a little further, if he should find it necessary; to land there, and, from the heights, endeavour to discover whether the land he was then upon, imagined to be the island of Alafchka, was really an island, or was connected with the land to the eastward, supposed to be the American continent. If it proved to be an island, he was to examine the depth of water in the channel between it and the continent, and which way the flood tide came: but, if he should find the two lands united, he was to return immediately to the ship. He was directed not to be absent longer than four or five days; and it was also mentioned in his instructions, that, if any unforeseen or unavoidable accident should force our ships off the coast, the rendezvous was to be at the harbour of Samganoodha. On Tuesday the 15th, the ships removed over to the bay on the south eastern side of Cape Denbigh, where we cast anchor in the afternoon. Not long after, several of the inhabitants came off in canoes, and gave us some dried salmon in exchange for trifling articles. Early the next morning, nine men, each in a separate canoe, paid us a visit, with the sole view of gratifying their curiosity. They approached the ship with caution, and drawing up abreast of each other, under our stern, favoured us with a song; while one of their number made many ludicrous motions with his hands and body, and another beat upon a sort of drum. There was nothing savage, either in the song, or the gestures with which it was accompanied. There seemed to be no difference, either with respect to size or features, between these people, and those whom we had seen on every other part of the coast, except King George's Sound. Their dress, which chiefly consisted of the skins of deer, was made after the same mode; and they had adopted the practice of perforating their lower lips, and affixing ornaments to them. The habitations of these Americans were situated close to the beach. They consist merely of a sloping roof, without any side-walls, formed of logs, and covered with earth and grass. The floor is likewise laid with logs. The entrance is at one end, and the fire-place is just within it. A small hole is made near the door of the hut, for the purpose of letting out the smoke. A party of men was dispatched, this morning, to the peninsula for brooms and spruce. Half the remainder of the people of both ships were, at the same time, permitted to go ashore and gather berries. These returned on board about twelve o'clock, and the other half then landed for the same purpose. The berries found here were huckle-berries, heath-berries, partridge-berries, and wild currant-berries. Captain Cook also went ashore himself, and took a walk over part of the peninsula. He met with very good grass in several places, and scarcely observed a single spot on which some vegetable was not growing. The low land by which this peninsula is united to the continent, abounds with narrow creeks, and likewise with ponds of water, several of which were at this time frozen over. There were numbers of bustards and geese, but they were so shy, that it was impossible to get within musket-shot of them. Some snipes were also seen; and, on the higher grounds, were partridges of two species; where there was wood, musquitoes were numerous. Some of

the officers, who went further into the country than Captain Cook did, met with some of the natives of both sexes, who treated them with civility and kindness. The Commodore was of opinion, that this peninsula had been an island in some distant period; for there were marks of the sea having formerly flowed over the isthmus; and even at present, it appeared to be kept out by a bank of sand, stones, and wood, which the waves had thrown up. It was manifest from this bank, that the land here encroached upon the sea, and it was not difficult to trace its gradual formation.

Lieutenant King returned from his expedition about seven o'clock this evening. He had set out at eight o'clock at night, on the 14th. The crews of the boats rowed without intermission towards the land, till one in the morning of the 15th. They then set their sails, and stood across the bay, which the coast forms to the westward of Bald-Head. They afterwards, about three o'clock, again made use of their oars, and, by two in the afternoon, had got within two miles of Bald-Head, under the lee of the high land. At that time all the men in the boat belonging to the Resolution, except two, were so oppressed with fatigue and sleep, that Mr. King's utmost endeavours to make them put on were perfectly ineffectual. They, at length, were so far exhausted, as to drop their oars, and fall asleep at the bottom of the boat. In consequence of this, Mr. King, and two gentlemen who were with him, were obliged to lay hold of the oars; and they landed, a little after three o'clock, between Bald-Head and a point that projects to the eastward. Mr. King, upon his landing, ascended the heights, from which he could see the two coasts join, and that the inlet terminated in a small creek or river, before which there were banks of sand or mud, and in every part shoal water. The land, for some distance towards the north, was low and swampy; then it rose in hills; and the perfect junction of those, on each side of the inlet, was traced without the least difficulty. From the elevated situation in which Mr. King took his survey of the Sound, he could discern many spacious valleys, with rivers flowing through them, well wooded, and bounded by hills of a moderate height. One of the rivers towards the N. W. seemed to be considerable; and he was inclined to suppose, from its direction, that it discharged itself into the sea at the head of the bay. Some of his people, penetrating beyond this into the country, found the trees to be of a larger size the further they proceeded. To this inlet Captain Cook gave the name of Norton's Sound, in honour of Sir Fletcher Norton, now Lord Grantley; a near relation of Mr. King. It extends northward as far as the latitude of 64 deg. 55 min. N. The bay, wherein our ships were now at anchor, is situated on the south-eastern side of it, and is denominated Chacktoole by the natives. It is not a very excellent station, being exposed to the S. and S. W. winds. Nor is a harbour to be met with in all this Sound. We were so fortunate, however, as to have the wind from the N. E. and the N. during the whole time of our continuance here, with very fine weather. This afforded an opportunity of making a great number of lunar observations, the mean result of which gave 197 deg. 13 min. E. as the longitude of the anchoring place on the western-side of the Sound, while its latitude was 64 deg. 31 min. N. With respect to the tides, the night flood rose two or three feet, and the day flood was scarcely perceivable. Captain Cook being now perfectly convinced, that Mr. Stæhlin's map was extremely erroneous, and having restored the continent of America to the space which that gentleman had occupied with his imaginary island of Alafchka, thought it now high time to quit these northerly regions, and retire to some place for the winter, where he might obtain provisions and refreshments. He did not consider Petropaulowska, or the harbour of St. Peter and St. Paul in Kamtschatka, as likely to furnish a sufficient supply. He had likewise other reasons for not going thither at present; the principal of which was, his great unwillingness to remain inactive for six or seven months, which would have been the consequence of passing the winter

winter in any of these northern countries. He at length concluded, that no situation was so convenient for our purpose as the Sandwich Islands. To them, therefore, he formed a resolution of repairing. But a supply of water being necessary before he could execute that design, he determined, with a view of procuring this essential article, to search the coast of America for a harbour, by proceeding along it to the southward. If he should not meet with success in that search, his intention was to reach Saniganoodha, which was appointed for our place of rendezvous, in case the ships should happen to separate.

On Thursday, the 17th, in the morning we weighed anchor with a light easterly breeze, and steering to the southward, attempted to pass within Beſborough Island; but, though it is six or seven miles distant from the continent, we were prevented, by meeting with shoal water. Having but little wind all the day, we did not pass that island before it was dark; and the night was spent under an easy sail. On the 18th, at day break, we resumed our progress along the coast. At noon, our soundings were no more than five fathoms. Beſborough Island, at this time, bore N. 42 deg. E. the most southerly land in sight, which also proved to be an island, bore S. 66 deg. W. the passage between it and the continent, was in the direction of S. 40 deg. W. and the nearest land was at the distance of about two miles. We continued to steer for this passage, till the boats which were a-head made the signal for having no more than three fathoms water. In consequence of this, we hauled without the island, and displayed the signal for the Resolution's boat to keep between the shore and the ships. This island, to which the name of Stuart's Island was given, lies in the latitude of 63 deg. 35 min. N. and is 17 leagues distant from Cape Denbigh, in the direction of S. 27 deg. W. It is six or seven leagues in circumference. Though some parts of it are of a moderate height, yet, in general, it is low, with some rocks off the western part. The greatest part of the coast of the continent is low land, but we perceived high land up the country. It forms a point, opposite the island, which was distinguished by the name of Cape Stephens, and is situated in the latitude of 63 deg. 33 min. N. and in the longitude of 197 deg. 41 min. E. Some drift wood was observed on the shores, both of the island and of the continent; but not a single tree was seen growing upon either. Vessels might anchor, upon occasion, between the continent and the N. E. side of this island, in a depth of five fathoms, sheltered from the easterly, westerly, and southerly winds. But this station would be entirely exposed to the northerly winds, the land, in that direction, being too remote to afford any security. Before we reached Stuart's Island, we passed two little islands, situate between us and the main land; and as we ranged along the coast, several of the natives made their appearance upon the shore, and, by signs, seemed to invite us to approach.

We were no sooner without the island, than we steered S. by W. for the most southern part of the continent in sight, till eight in the evening, when, the depth of water having decreased from six fathoms to less than four, we tacked and stood to the northward into five fathoms, and then passed the night in standing off and on. At the time we tacked, the southernmost point of land above mentioned, which we named Point Shallow Water, bore S. half E. at the distance of seven leagues. On the 19th, at day break, we resumed our southerly course; but shoal water soon obliged us to haul more to the westward. We were at length so far advanced upon the bank, that we could not hold a N. N. W. course, as we sometimes met with only four fathoms. The wind blowing fresh at E. N. E. it was now high time to endeavour to find a greater depth of water, and to quit a coast upon which we could no longer navigate with safety. We therefore hauled the wind to the northward, and the water gradually increased in depth to eight fathoms. At this time, we were about twelve leagues distant from the continent, and nine to the W. of Stuart's Island. We saw no land to the southward of Point Shallow Water, which Captain

Cook judged to lie in the latitude of 63 deg. N. so that between this latitude and Shoal Neſs, in latitude 60 deg. the coast has not been explored. It is probably accessible only to boats, or very small vessels; or, if there are channels for vessels of greater magnitude, it would require some time to find them. From the mast head, the sea within us appeared to be chequered with shoals; the water was very muddy and discoloured, and much fresher than at any of the places where our ships had lately anchored. From this we inferred, that a considerable river runs into the sea, in this unexplored part. After we had got into eight fathoms water, we steered to the westward, and afterwards more southerly, for the land discovered by us on the 5th of September, which at noon on the 20th, bore S. W. by W. at the distance of ten or eleven leagues. We had now a fresh gale at N. and, at intervals, showers of hail and snow, with a pretty high sea. To the land before us, the Commodore gave the appellation of Clerke's Island. It stands in the latitude of 63 deg. 15 min. and in the longitude of 190 deg. 30 min. It seemed to be an island of considerable extent, in which are several hills, all connected by low ground, so that it looks, at a distance, like a group of islands. Near its eastern part is a little island, which is remarkable for having on it three elevated rocks. Both the greater island, and this smaller one, were inhabited. In the afternoon, about six o'clock, we reached the northern point of Clerke's Island; and having ranged along its coast till dark, we brought to during the night. Early the next morning, we again stood in for the coast, and proceeded along it in quest of an harbour, till twelve o'clock, when finding no probability of success, we left it and steered S. S. W. for the land discovered by us on the 29th of July; having a fresh gale at N. accompanied with showers of snow and sleet.

Wednesday the 23d, at day break, the land above mentioned made its appearance, bearing S. W. at the distance of six or seven leagues. From this point of view, it resembled a cluster of islands; but it was found to be only one, of about thirty miles in extent, in the direction of N. W. and S. E. the south-eastern extremity being Cape Upright, which we have mentioned before. The island is narrow, particularly at the low necks of land by which the hills are connected. Captain Cook afterwards found, that it was entirely unknown to the Russians, and therefore, considering it as a discovery of our own, he named it Gore's Island. It appeared to be barren and destitute of inhabitants, at least we saw none. Nor did we observe such a number of birds about it, as we had seen when we first discovered it. But we perceived some sea-otters, an animal which we had not found to the N. of this latitude. About twelve miles from Cape Upright, in the direction of S. 72 deg. W. stands a small island, whose lofty summit terminates in several pinnacle rocks, for which reason it obtained the name of Pinnacle Island. At two o'clock P. M. after we had passed Cape Upright, we steered S. E. by S. for Samganoodha, with a gentle breeze at N. N. W. being resolved to lose no more time in searching for an harbour among islands, which we now began to suspect had no existence; at least, not in the latitude and longitude in which they have been placed by modern delineators of charts. On the 24th in the evening, the wind veered to S. W. and S. and increased to a fresh gale. We continued our easterly course till eight in the morning of the 25th, when in the longitude of 191 deg. 10 min. and in the latitude of 58 deg. 32 min. we tacked and stood to the westward; soon after which, the gale increasing, we were reduced to two courses, and close-reefed main-top-sails. In a short time after, the Resolution sprung a leak, under the starboard buttock, which was so considerable, as to keep one pump constantly employed. We would not venture to put the ship upon the other tack, from the apprehension of getting upon the shoals that lie to the N. W. of Cape Newenham; but continued to steer towards the W. till six in the evening of Saturday the 26th, when we wore and stood to the eastward; and then the leak gave us no farther trouble. This proved, that

that it was above the water-line, which gave us great satisfaction. The gale had now ceased, but the wind continued at S. and S. W. for some days longer.

On Friday the 2nd of October, at day break, we saw the isle of Oonalashka, in a S. E. direction. But as the land was obscured by a thick haze, we were not certain with respect to our situation till noon, when the observed latitude determined it. We hauled into a bay, ten miles to the westward of Samganoodeha, known by the name of Egoochshac; but finding very deep water, we speedily left it. The natives visited us at different times, bringing with them dried salmon, and other fish, which our sailors received in exchange for tobacco. Only a few days before, every ounce of tobacco that remained in the ship, had been distributed among them, and the quantity was not half sufficient to answer their demands. Notwithstanding this, so thoughtless and improvident a being is an English sailor, that they were as profuse in making their bargains, as if we had arrived at a port in Virginia; by which means, in less than two days, the value of this commodity was lowered above a thousand per cent. The next day, at one o'clock in the afternoon, we anchored in the harbour of Samganoodeha, and, on the morning of the 4th, the carpenters were employed in ripping off the sheathing of and under the wale of the *Resolution* on the star-board side. Many of the seams were found entirely open; it was therefore not to be wondered at, that so much water had got into the ship. We cleared the fish and spirit rooms, and the after-hold; and disposed things in such a manner, that, in case of any future leaks of the same nature, the water might find its way to the pumps. Besides this work, and completing our stock of water, we cleared the fore-hold, and took in a quantity of ballast.

The vegetables we had met with when we were here before, were now, for the most part, in a state of decay. There being great plenty of berries, one-third of the people, by turns, had permission to go a-shore and gather them. Considerable quantities of them were also brought to us by the inhabitants. If there were any seeds of the scurvy, among the people of either ship, these berries, and the use of spruce beer, which they were allowed to drink every other day, effectually eradicated them. We likewise procured abundance of fish; at first, chiefly salmon, both fresh and dried, which the natives brought us. Some of the fresh salmon was in the highest perfection; but there was one sort, which, from the figure of its head, we called hook-nosed, that was but indifferent. Drawing the seine several times, at the head of the bay, we caught many salmon trout, and a halibut that weighed 254 pounds. We afterwards had recourse to hooks and lines. A boat was sent out every morning, which seldom returned without eight or ten halibut, a quantity more than sufficient to serve all our people. These fish were excellent, and there were few who did not prefer them to salmon. Thus we not only obtained a supply of fish for present consumption, but had some to carry with us to sea. On the 8th, Captain Cook received, by the hands of a native of Oonalashka, named Derramoushk, a very singular present, considering the place we were in. It was a rye loaf, or rather a pye in the form of a loaf, as it enclosed some salmon, well seasoned with pepper. This man had brought a similar present for Captain Clerke, and a note for each of the Captains, written in a character which none of us understood. It was natural to imagine, that these two presents were from some Russians now in our neighbourhood, and therefore the Captains sent, by the same messenger, to these unknown friends, a few bottles of rum, wine and porter, which they supposed would be highly acceptable. Captain Cook also sent, in Company with Derramoushk, Corporal Lediard, of the marines, an intelligent man, for the purpose of gaining farther information; with orders, that if he met with any Russians, he should endeavour to make them understand, that we were Englishmen, the friends and allies of their nation.

Saturday the 10th, Corporal Lediard returned with three Russian seamen, or furriers, who with several

others resided at Egoochshac, where they had some store-houses, a dwelling-house, and a sloop of about 30 tons burthen. One of these Russians was either Master or Mate of this vessel. They were all three intelligent well-behaved men, and extremely ready to give us all the information we could desire. But for want of an interpreter, we found it very difficult to understand each other. They appeared to have a perfect knowledge of the attempts which their countrymen had made to navigate the Frozen Ocean, and of the discoveries that had been made from Kamtschatka, by Beering, Tschirikoff, and Spangenberg. But they had not the least idea to what part of the world Mr. Stahlin's map referred, when it was laid before them. When Captain Cook pointed out Kamtschatka, and some other places upon this map, they asked him whether he had seen the islands there represented; and, on his answering in the negative, one of them put his finger upon a part of the map, where a number of islands are laid down, and said that he had cruised there in search of land, but could never meet with any. The Captain then shewed them his own chart, and found that they were strangers to every part of the coast of America, except that which lies opposite this island. One of these men said, that he had been with Beering in his American voyage; but he must then have been very young; for even now, at the distance of 37 years, he had not the appearance of being aged. Never was greater respect paid to the memory of any eminent person, than by these men to that of Beering. The trade in which they are engaged is very advantageous, and its being undertaken and extended to the eastward of Kamtschatka, was the immediate result of the second voyage of that distinguished navigator, whose misfortunes proved the source of much private benefit to individuals, and of public utility to the Russian empire. And yet, if his distresses had not accidentally carried him to the island which bears his name, where he ended his life, and from whence the remainder of his ship's crew brought back specimens of its valuable furs, the Russians would probably have undertaken no future voyages, which could lead them to make discoveries in this sea, towards the American coast. Indeed, after his time, their ministry seem to have paid less attention to this object; and for what discoveries have been since made, we are principally indebted to the enterprising spirit of private merchants, encouraged, however, by the superintending care of the court of Petersburg. The three Russians having remained all night with the Commodore, visited Captain Clerke the following morning, and then departed, perfectly satisfied with the reception they had met with. They promised to return in a few days, and bring with them a chart of the islands situate between Kamtschatka and Oonalashka. In the evening of the 14th, while Captain Cook and Mr. Webber were at a village, not far from Samganoodeha, a Russian landed there, who proved to be the principal person among his countrymen in this and the adjacent isles. His name was Erasim Gregoroff Sin Ismyloff. He arrived in a canoe that carried three persons, attended by twenty or thirty smaller canoes, each conducted by one man. Immediately after landing, they constructed a small tent for Ismyloff, of materials which they had brought with them, and they afterwards made others for themselves, of their canoes and paddles, which they covered with grass. Ismyloff having invited the Captain and Mr. Webber into his tent, set before them some dried salmon and berries. He appeared to be a man of sense; and the Captain felt no small mortification in not being able to converse with him, except by signs, with the assistance of figures, and other characters. The Captain requested him to favour him with his company on board the next day, and accordingly he came with all his attendants. He had indeed moved into the neighbourhood of our station, for the express purpose of waiting upon us. The Commodore was in hopes of receiving from him the chart which his three countrymen had promised, but he was disappointed. However, Ismyloff assured him he should have it, and he kept his word. The Captain

Captain found him very well acquainted with the geography of those parts, and with all the discoveries which had been made in this quarter by the Russians. On seeing the modern maps, he instantly pointed out their errors: he said he had accompanied Lieutenant Syndo, or (as he called him) Synd, in his northern expedition; and, according to his account, they did not proceed farther than the Tschukotskoi Nofs, or rather than St. Lawrence's Bay; for he pointed on our chart to the very place where Captain Cook landed. From thence he said they went to an island in the lat. of 63 deg. N. upon which they did not land. He did not recollect the name of that island; but the Captain conjectured, that it was the same with that to which the appellation of Clerke's Island had been given. To what place Synd repaired afterwards, or in what particular manner he employed the two years, during which, according to Ismyloff, his researches lasted, he was either unable or unwilling to inform us. Perhaps he did not comprehend our enquiries on this point; and yet, in almost every other thing, we found means to make him understand us. This inclined us to suspect, that he had not really been in this expedition, notwithstanding what he had asserted. Not only Ismyloff, but also the others affirmed, that they were totally unacquainted with the American continent to the northward; and that neither Lieutenant Synd, nor any other Russian, had seen it of late years. They called it by the same name which Mr. Stæhlin has affixed to his large island, that is Alaschka. According to the information we obtained from Ismyloff and his countrymen, the Russians have made several attempts to gain a footing upon that part of the North American continent, that lies contiguous to Oonalaschka and the adjacent islands, but have constantly been repulsed by the inhabitants, whom they represent as a very treacherous people. They made mention of two or three Captains, or chief men, who had been murdered by them; and some of the Russians shewed us wounds, which they declared they had received there. Ismyloff also informed us, that in the year 1773, an expedition had been undertaken into the Frozen Ocean in sledges, over the ice, to three large islands that are situate opposite the mouth of the river Kovyra. But a voyage which he said he himself had performed, engaged our attention more than any other. He told us that on the 12th of May, 1771, he sailed from Bolcheretzk, in Kamtschatka, in a Russian vessel to Mareekan, one of the Kurile islands, where there is an harbour, and a Russian settlement. From this island he proceeded to Japan, where his continuance appears to have been but short; for, as soon as the Japanese knew that he and his companions professed the Christian faith, they made signs for them to depart; but did not, so far as we could understand him, offer any insult or violence. From Japan he repaired to Canton, in China; and from thence, in a French ship to France. He then travelled to Petersburg, and was afterwards sent out again to Kamtschatka. We could not learn what became of the vessel in which he first embarked, nor what was the principal intention of the voyage. His being unable to speak one word of the French language, rendered this story rather suspicious; he seemed clear, however, as to the times of his arrival at the different places, and of his departure from them, which he put down in writing. The next morning (Friday the 16th) he offered Captain Cook a sea-otter skin, which he said was worth 80 roubles at Kamtschatka. The Captain, however, thought proper to decline the offer; but accepted of some dried fish, and several baskets of the lily, or Saranne root. In the afternoon, Ismyloff, after having dined with Captain Clerke, left us with all his retinue, but promised to return in a few days. Accordingly, on the 19th, he paid us another visit, bringing with him the charts above-mentioned, which he permitted Captain Cook to copy, and the contents of which are the foundation of the following remarks.

These charts were two in number, they were both manuscripts, and bore every mark of authenticity. One of them comprehended the Penhinsian sea; the coast

of Tartary, as low as the lat. of 41 deg. N. the Kurile Islands, and the peninsula of Kamtschatka. Since this chart had been made, Wawseele Irkeechoff, a naval captain, explored, in the year 1758, the coast of Tartary, from Okotsk, and the river Amur, to Japan, or 41 deg. of northern lat. We were informed by Mr. Ismyloff, that a great part of the sea-coast of Kamtschatka had been corrected by himself; and he described the instrument used by him for that purpose, which must have been a theodolite. He also told us, that there were only two harbours proper for shipping, on all the eastern coast of Kamtschatka, viz. the bay of Awatska, and the river Olutora, in the bottom of the gulph of the same name; that there was not one harbour on its western coast; and that Yamsk was the only one, except Okotsk, on all the western side of the Penhinsian sea, till we come to the river Amur. The Kurile Islands contain but one harbour, and that is on the N. E. side of Mareekan; where, as we have already mentioned, the Russians have a settlement. The other chart comprehended all the discoveries that the Russians had made to the eastward of Kamtschatka, towards America. That part of the American coast, with which Tschirikoff fell in, is laid down in this chart between the lat. of 58 deg. and 58 and an half deg. N. and 75 deg. of eastern long. from Okotsk, or 218 and an half deg. from Greenwich; and the place where Beering anchored in 59 and an half deg. of lat. and 63 and an half deg. of long. from Okotsk, or 207 deg. from Greenwich. To say nothing of the long. which may, from several causes, be erroneous, the lat. of the coast discovered by Beering and Tschirikoff, particularly that part of it which was discovered by the latter, differs considerably from Mr. Muller's chart. Whether the chart now produced by Ismyloff, or that of Muller, be most erroneous in this respect, it may be difficult to determine. According to Ismyloff's account, neither the number nor the situation of the islands which are dispersed between 52 deg. and 55 deg. of lat. in the space between Kamtschatka and America, is properly ascertained. He struck out about a third of them, assuring us that they did not exist; and he considerably altered the situation of others, which he said was necessary, from the observations which he himself had made; and there was no reason to entertain a doubt about this. As these islands are nearly under the same parallel, different navigators, misled by their different reckonings, might easily mistake one island, or cluster of islands for another; and imagine they had made a new discovery, when they had only found old ones; in a position somewhat different from that which their former visitors had assigned to them. The isles of St. Theodore, St. Stephen, St. Abraham, St. Macarius, Seduction Island, and several others, which are represented in Mr. Muller's chart, were not to be found in this now produced to us; nay, Ismyloff and the other Russians assured Captain Cook, that they had been frequently sought for without effect. Nevertheless, it is difficult to believe, that Mr. Muller could place them in his chart without some authority. Captain Cook, however, confiding in the testimony of these people, whom he thought competent witnesses, omitted them in his chart; and made such corrections respecting the other islands, as he had reason to think were necessary.

We shall now proceed to give some account of the islands, beginning with those which are nearest to Kamtschatka, and computing the long. from the harbour of Petropaulowska, in the bay of Awatska. The first is Beering's island, in 55 deg. of northern lat. and 6 deg. of eastern long. At the distance of 10 leagues from the southern extremity of this, in the direction of E. by S. or E. S. E. stands Maidenoi Ostroff, or the Copper Island. The next island is Atakou, in the lat. of 52 deg. 45 min. and in the long. of 15 deg. or 16 deg. The extent of this island is about 18 leagues in the direction of E. and W. and it is perhaps the same land which Beering fell in with, and to which he gave the name of Mount St. John. We next come to a cluster of six or more islands; two of which, Amluk and Arghka, are of considerable extent, and each of them

has a good harbour. The middle of this group lies in the lat. of 52 deg. 30 min. and 28 deg. of long. from the bay of Awatka, and its extent is about four degrees in the direction of E. and W. These are the isles that Ismyloff said were to be removed four degrees to the eastward. In the situation they have in Captain Cook's chart, was a group, comprehending 10 little islands, which we were informed were entirely to be struck out; and also two islands, situate between them and the group to which Oonalashka appertains. In the place of these two, an island, named Amoghta, was introduced.

The situation of many of these islands may, perhaps, be erroneously laid down. But the position of the largest group, of which Oonalashka is one of the most considerable islands, is free from such errors. Most of the islands that compose this cluster, were seen by us; their long. and lat. were therefore determined with tolerable accuracy; particularly the harbour of Samganoodha, in Oonalashka, which must be considered as a fixed point. This group may be said to extend as far as Halibut Isles, which are forty leagues distant from Oonalashka, towards the E. N. E. Within these isles, a passage, communicating with Bristol Bay, was marked in Ismyloff's chart, which converts about 15 leagues of the coast, that Captain Cook had supposed to be part of the continent, into an island, named Oonecmak. This passage might easily escape us, being, as we were informed, extremely narrow, shallow, and only to be navigated through with boats, or vessels of very small burthen. From the chart, as well as from the testimony of Ismyloff and his countrymen, it appears, that this is as far as the Russians have made any discoveries, or have extended themselves, since the time of Beerig. They all affirmed, that no persons of that nation had settled themselves so far to the eastward, as the place where the natives gave the note to Captain Clerke; which being delivered to Ismyloff for his refusal, he said, that it had been written at Oomanak. From him we procured the name of Kodiak, the largest of Schumagin's Islands; for it had no name assigned to it upon the chart which he produced. It may not be improper to mention, that no names were put to the islands which Ismyloff said were to be struck out of the chart; and Captain Cook considered this as some confirmation that they have no existence. The American continent is here called by the Russians, as well as by the islanders, Alashka; which appellation, though it properly belongs only to that part which is contiguous to Oonecmak, is made use of by them when speaking of the American continent in general. This is all the intelligence we obtained from these people, respecting the geography of this part of the globe; and perhaps this was all the information they were able to give. For they repeatedly assured Captain Cook, that they knew of no other islands, besides those which were represented upon this chart, and that no Russian had ever visited any part of the American continent to the northward, except that which is opposite the country of the Tschutkis. If Mr. Stæhlin was not greatly imposed upon, what could induce him to publish a map so singularly erroneous as his map of the New northern Archipelago, in which many of these islands are jumbled together without the least regard to truth? Nevertheless, he himself styles it "a very accurate little map."

Ismyloff continued with us till the evening of the 21st, when he took his final leave. Captain Cook entrusted to his care a letter to the Lords of the Admiralty, enclosing a chart of all the northern coasts we had visited. Ismyloff said there would be an opportunity of transmitting it to Kamtschatka, or Okotsk, in the course of the succeeding spring; and that it would be at Petersburg the following winter. He gave the Captain a letter to Major Behm, Governor of Kamtschatka, who resides at Bolcheretsk, in that peninsula; and another to the commanding officer at Petropaulowka. This gentleman seemed to possess abilities that might entitle him to a higher station than that in which we found him. He had considerable knowledge

in astronomy, and in the most useful branches of the mathematics. Captain Cook made him a present of an Hadley's octant; and though, perhaps, it was the first he had ever seen, he very quickly made himself acquainted with most of the uses to which that instrument can be applied.

Thursday the 22d, in the morning, we made an attempt to get out to sea, with the wind at S. E. but did not succeed. In the afternoon of the 23d, we were visited by one Jacob Ivanovitch Soposnicoff, a Russian, who commanded a small vessel at Oomanak. This man seemed very modest, and would drink no strong liquor, of which the other Russians, whom we had met with here, were extremely fond. He appeared to know what supplies could be obtained at the harbour of St. Peter and St. Paul, and the price of the various articles, more accurately than Mr. Ismyloff. But by all accounts, every thing we should have occasion to purchase at that place, was very scarce, and bore a high price. This man informed us, that he was to be at Petropaulowka in the ensuing May; and, as we understood, was to have the charge of Captain Cook's letter. He seemed very desirous of having some token from the Captain to carry to Major Behm; and to gratify him, the Captain sent a small spying-glass. After we had contracted an acquaintance with these Russians, several of our gentlemen, at different times, visited their settlement on the island, where they always met with very friendly treatment. It consisted of a dwelling-house and two store-houses. Besides the Russians, there was a number of the Kamtschadales, and of the Oonalashkans, as servants to the former. Some other natives of this island, who appeared to be independent of the Russians, lived at the same place. Such of them as belonged to the Russians, were all of the male sex; and they are either taken or purchased from their parents when young. There were at present about twenty of these, who could be considered in no other light than as children. They all reside in the same house, the Russians at the upper end, the Kamtschadales in the middle, and the Oonalashkans at the lower end, where is fixed a capacious boiler for preparing their food, which principally consists of fish, with the addition of wild roots and berries. There is no great difference between the first and last table, except what is produced by cookery, by which the Russians can make indifferent things palatable. They dress whale's flesh in such a manner as to make it very good eating; and they have a kind of pan-pudding of salmon-roe, beaten up fine and fried, which is a tolerable substitute for bread. They may, perhaps, occasionally taste real bread, or have a dish in which flour is one of the ingredients. If we except the juice of berries, which they generally sip at their meals, they drink no other liquor than pure water; and it seems to be very fortunate for them that they have nothing stronger. As the island furnishes them with subsistence, so it does in some measure with clothing. This is chiefly composed of skins. The upper garment, which is made like a waggoner's frock, reaches down to the knees. Besides this, they wear a waistcoat or two, a pair of breeches, a fur cap, and a pair of boots, the legs of which are formed of some kind of strong gut, but the soles and upper leathers are of Russian leather. Their two Chiefs, Ismyloff and Ivanovitch, wore a calico frock; and they, as well as several others, had shirts of silk. Many Russians are settled upon all the most considerable islands between Kamtschatka and Oonalashka, for the purpose of collecting furs. Their principal object is the sea-beaver or otter; but skins of inferior value also make a part of their cargoes. We neglected to enquire how long they have had a settlement upon Oonalashka, and the neighbouring islands; but if we form our judgment on this point from the great subjection the natives are under, this cannot be of a very late date. These furriers are from time to time succeeded by others. Those we saw arrived here from Okotsk in 1776, and were to return in 1781.

As for the native inhabitants of this island, they are to all appearance a very peaceable, inoffensive race of people; and in point of honesty, they might serve as a pattern

The Inside of a House in OONALASHUA

Portrait of a woman of OONASHUKA

Portrait of a man of OONASHUKA

pattern to the most civilized nations. But, from what we saw of their neighbours, with whom the Russians are unconnected, we have some doubt whether this was their original disposition; and are rather inclined to be of opinion, that it is the consequence of their present state of subjection. Indeed, if we did not misunderstand the Russians, they had been under the necessity of making some severe examples before they could bring the islanders into tolerable order. If severities were really inflicted at first, the best excuse for them is, that they have produced the most beneficial effects; and, at present, the greatest harmony subsists between the Russians and the natives. The latter have their own chiefs in each island, and seem to enjoy liberty and property without molestation. Whether they are tributaries to the Russians, or not, we could never learn; but we had some reason to suppose that they are.

The people of Oonalashka are in general rather low of stature, but plump, and well shaped. Their necks are commonly short, and they have swarthy chubby faces. They have black eyes, and small beards. Their hair is long, black, and straight: the men wear it loose behind, and cut before; but the women generally tie it up in a bunch. The dress of both sexes is the same with respect to fashion, the only difference is in the materials. The frock worn by the women is made of the skins of seals; and that of the men, of the skins of birds; both reach below the knees. This constitutes the whole dress of the females. But, over the frock, the men wear another composed of gut, which water cannot penetrate; it has a hood to it, which is drawn over the head. Some of them wear boots; and all of them wear a sort of oval snouted cap, made of wood, with a rim that admits the head. They dye these caps with green and other colours; and round the upper part of the rim they fix the long bristles of some sea animal, on which glass beads are strung; and on the front is a small image or two formed of bone. They do not make use of paint; but the women puncture their faces slightly, and both sexes perforate the lower lip, in which they fix pieces of bone. But it is as uncommon here to see a man with this ornament, as to observe a woman without it. Some fix beads to the upper lip under the nostrils; and they all suspend ornaments in their ears.

Fish and other sea animals, birds, roots, berries, and even sea-weed, compose their food. They dry quantities of fish during the summer, which they lay up in small huts for their use in winter; and, probably, they preserve berries and roots for the same season of scarcity. They eat most of their provisions raw. Boiling and broiling were the only methods of cookery that we saw practised among them; and the former they in all probability learnt from the Russians. Some have in their possession small brass kettles; and those who have not, make one of a flat stone, with sides of clay. Captain Cook once happened to be present, when the chief of this island made his dinner of the raw head of a large halibut, just caught. Before any part of it was given to the chief, two of his servants eat the gills, with no other dressing than squeezing out the slime. After this, one of them having cut off the head of the fish, took it to the sea, and washed it, then came with it, and seated himself by the chief; but not before he had pulled up some grass, upon a part of which the head was placed, and the rest was strewed before the chief. He then cut large pieces off the cheeks, and put them within the reach of the chief, who swallowed them with great satisfaction. When he had finished his meal, the remains of the head being cut in pieces, were given to the servants, who tore off the meat with their teeth, and gnawed the bones like so many dogs.

As the Oonalashkins use no paint, they are less dirty in their persons than those savages who thus besmear themselves; but they are full as filthy in their houses. The following is their method of building: they dig, in the ground, an oblong pit, which rarely exceeds fifty feet in length, and twenty in breadth; but the dimensions are in general smaller. Over this excavation they form the roof of wood, which they cover first with grass,

and then with earth, so that the external appearance resembles a dung-hill. Near each end of the roof is left a square opening, which admits the light; one of these openings being intended only for this purpose, and the other being also used to go in and out by, with the assistance of a ladder, or rather a post, in which steps are cut. In some of the houses there is another entrance below, but this is rather uncommon. Round the sides and ends of the habitations, the families, several of which dwell together, have their separate apartments, where they sleep, and sit at work; not on benches, but in a sort of concave trench, dug entirely round the inside of the house, and covered with mats, so that this part is kept pretty clean and decent. The same cannot be said of the middle of the house, which is common to all the families. For, though it is covered with dry grass, it is a receptacle for every kind of dirt, and the place where the urine trough stands; the stench of which is by no means improved by raw hides, or leather, being almost continually steeped in it. Behind, and over the trench, they place the few effects that they have in their possession, such as their mats, skins, and apparel. Their furniture consists of buckets, cans, wooden bowls, spoons, matted baskets, and sometimes a Russian kettle or pot. All these utensils are made in a very neat manner; and yet we observed no other tools among them than the knife and the hatchet; that is, a small flat piece of iron, made like an adze, by fixing it into a crooked wooden handle.

Though the Russians live among these people, we found much less iron in possession of the latter, than we had met with among other tribes on the neighbouring continent of America, who had never seen the Russians, nor perhaps had any intercourse with them. Probably a few heads, and a small quantity of tobacco and snuff, purchase all they have to spare. There are few of them that do not both smoke and chew tobacco, and take snuff. They did not appear to be very desirous of more iron, or to want any other instruments, except sewing needles, their own being formed of bone. With these they sew their canoes, and make their clothes, and also work very curious embroidery. They use, instead of thread, the fibres of sinews, which they split to the thickness which is required. All sewing is performed by the females. They are the shoe-makers, taylor, and boat-builders, or boat-coverers; for the men, in all probability, construct the wooden frame, over which the skins are sewed. They manufacture mats, and baskets of grass, which are both strong and beautiful. There is, indeed, a neatness and perfection in most of their work, that shews they are neither deficient in ingenuity nor perseverance. We did not observe a fire-place in any one of their habitations. They are lighted, as well as heated, by lamps; which, though simple, effectually answer the purpose for which they are intended. They consist of a flat stone, hollowed on one side like a plate; in the hollow part they put the oil, mixed with some dry grass, which serves for a wick. Both sexes often warm themselves over one of these lamps, by placing it between their legs, under their garments, and sitting thus over it for several minutes. These people produce fire both by collision and attrition; the first by striking two stones against each other, on one of which a quantity of brimstone has been previously rubbed. The latter method is performed by means of two pieces of wood, one of which is flat, and the other is a stick of the length of about a foot and a half. They press the pointed end of the stick upon the other piece, whirling it nimbly round as a drill, and thus fire is procured in a few minutes. This method is common in many countries. It is not only practised by these people, but also by the Kamtschadales, the Greenlanders, the Oraheiteans, the New Hollanders, and the Brazilians, and probably by other nations. Some men of learning and genius have founded an argument on this custom, to prove that this and that nation are of the same extraction. But casual agreements, in a few particular instances, will not wholly authorize such a conclusion; nor, on the other hand, will a disagreement, either in manners or customs, between two different

different nations, prove of course that they are of different extraction. We saw no offensive, nor even defensive weapon among the natives of Oonalashka. It can scarcely be supposed that the Russians found them in such a defenceless state; it is rather to be imagined, that, for their own security, they have disarmed them. Political motives, likewise, may have induced the Russians not to permit these islanders to have any large canoes; for we can hardly believe they had none such originally, as we found them among all their neighbours. However, we observed none here except two or three that belonged to the Russians.

The canoes in use among the natives, are smaller than any of those we had seen upon the coast of America, from which, however, they differ but little in their construction. The form of these terminates somewhat abruptly; the head is forked, and the upper point of the fork projects without the under one, which is level with the surface of the water. It is remarkable that they should thus construct them, for the fork generally catches hold of every thing that comes in the way; to prevent which, they fix a piece of small stick from one point to the other. In other respects they build their canoes after the manner of those of the Esquimaux and Greenlanders; the frame being of slender laths, and the covering of the skins of seals. They are about twelve feet in length, eighteen inches in breadth in the middle, and twelve or fourteen inches in depth. They sometimes carry two persons, one of whom sits in the seat, or round hole, which is nearly in the middle; and the other is stretched at full length in the canoe. Round this hole is a rim or hoop of wood, about which gut-skin is sewed, which can be drawn together, or opened like a purse, with leathern strings fitted to the outer edge. The man sits in this place, draws the skin tight about his body over his gut-frock, and brings the ends of the thongs, or purse-strings, tight round his wrists; and it being close round his neck, and the hood being drawn over his head, where his cap confines it, water cannot easily penetrate, either into the canoe, or to his body. If, however, any water should find means to insinuate itself, the boatman dries it up with a piece of sponge. He makes use of a double-bladed paddle, which is held with both hands in the middle, striking the water first on one side, and then on the other, with a quick regular motion. Thus the canoe is impelled at a great rate, and in a direction perfectly straight. In sailing from Egoochshak to Samganooodha, though our ship went at the rate of seven miles an hour, two or three canoes kept pace with her. Their implements for hunting and fishing lie ready upon their canoes, under straps fixed for the purpose. They are all extremely well made of wood and bone, and are not very different from those used by the Greenlanders. The only difference is in the point of the missile dart; which, in some that we saw at this island, does not exceed an inch in length; whereas those of the Greenlanders, according to Crantz, are about eighteen inches long. Indeed these darts, as well as some others of their instruments, are extremely curious. Their darts are generally made of fir, and are about four feet in length. The bird, fish, or other animal is no sooner struck, than the pointed bone slips out of the socket, but remains fixed in its body by means of the barb. The dart then serves as a float to trace the animal, and also contributes to fatigue it considerably, so that it is easily taken. They throw these darts by the assistance of a thin piece of wood, twelve or fourteen inches long; the middle of this is slightly hollowed, for the better reception of the weapon; and at the termination of the hollow, which does not extend to the end, is fixed a short pointed piece of bone, to prevent the dart from slipping. The other extremity is furnished with a hole for the reception of the fore-finger, and the sides are made to coincide with the other fingers and thumb, in order to grasp with greater firmness. The natives throw these darts to the distance of eighty or ninety yards, with great force and dexterity. They are exceedingly expert in striking fish, both in the sea, and in rivers. They also use hooks and lines, nets and weirs. The lines are formed of twisted sinews, and the hooks of bone.

Whales, porpoises, grampuses, halibut, sword-fish, salmon, trout, cod, soals, flat-fish, and several other sorts, are found here; and there may be many more that we had not an opportunity of seeing. Salmon and halibut appear to be in the greatest plenty; and on them the people of these isles principally subsist; at least, they were the only sort of fish, except cod, that we observed to be laid up for their winter store. Seals, and all that tribe of sea animals, are not so numerous as they are in many other seas. Nor can this be thought surprizing, since there is hardly any part of the coast, on either continent, nor any of these islands, situate between them, but what is inhabited, and whose inhabitants hunt these animals for their food and clothing. Sea-horses are, indeed, to be found in prodigious numbers about the ice; and the sea-otter is scarce any where to be met with but in this sea. An animal was sometimes seen by us, that blew after the manner of whales. It had a head resembling that of a seal. It was larger than that animal, and its colour was white, with dark spots interperfed. This was perhaps the manati, or sea-cow.

Water fowls are neither found here in such numbers, nor in such variety, as in the northern parts of the Atlantic Ocean. However there are some in these parts, that we do not recollect to have seen in other countries; particularly the alca monochroa of Steller, and a black and white deck, which we judge to be different from the stone-duck that Krasneninikoff has described in his History of Kamtschatka. All the other birds we saw are mentioned by this author, except some which we observed near the ice; and the greatest part of these, if not all, have been described by Martin, in his voyage to Greenland. It is somewhat extraordinary, that penguins, which are so frequently met with in many parts of the world, should not be found in this sea. Albatrosses too are extremely scarce here. The few land birds seen by us are the same with those of Europe; but there were probably many others which we had no opportunity of observing. A very beautiful bird was shot in the woods at Norton Sound; which, we understand, is sometimes found in England, and known by the appellation of chatterer. Our people saw other small birds there, but in no great abundance or variety; such as the bullfinch, the wood-pecker, the yellow-finch, and tit-mouse.

Our excursions and observations being confined to the sea coast, we cannot be expected to have much knowledge of the animals or vegetables of the country. There are few other insects besides musquitoes, and we saw few reptiles except lizards. There are no deer at Oonalashka, or any of the neighbouring islands; nor are there any domestic animals, nor even dogs. Weasels and foxes were the only quadrupeds we observed; but the natives told us, that they had likewise hares, and the marmottas mentioned by Krasneninikoff. Hence it appears, that the inhabitants procure the greatest share of their food from the sea and rivers. They are also indebted to the sea for all the wood which they use for building, and other necessary purposes; as there is not a tree to be seen growing upon any of the islands, nor upon the neighbouring coast of the continent. The seeds of plants are said to be conveyed, by various means, from one part of the world to another; even to islands lying in the midst of extensive oceans, and far distant from any other lands. It is therefore remarkable, that there are no trees growing on this part of the American continent, nor upon any of the adjacent isles. They are doubtless as well situated for receiving seeds, by the various ways we have heard of, as those coasts which have plenty of wood. Nature has, perhaps, denied to some soils the power of raising trees, without the assistance of art. With respect to the drift-wood, upon the shores of these islands, we have no doubt of its coming from America. For though there may be none on the neighbouring coast, a sufficient quantity may grow farther up the country, which may be broken loose by torrents in the spring, and brought down to the sea; and not a little may be conveyed from the woody coasts, though situated

ated at a more considerable distance. But plants are to be found in great variety at Oonalashka. Several of them are such as we meet with in Europe, and also in Newfoundland, and other parts of America; and others of them, which are likewise found in Kamtschatka, are eaten by the natives both there and here. Of these, Krasheninikoff has favoured us with descriptions. The principal one is the Saranne, or lily root; which is about as large as a root of garlick, round, and composed of a number of small cloves and grains. When boiled it somewhat resembles saloop; the taste of it is not disagreeable. It does not appear to be in great abundance. Among the food of the natives we may reckon some other wild roots; the stalk of a plant not unlike angelica; and berries of different species, such as cranberries, huckle-berries, bramble-berries, and heath-berries; besides a small red berry, which, in Newfoundland, is denominated partridge berry; and another brown berry, with which we were unacquainted. This has somewhat of the taste of a sloe, but is different from it in every other respect. When eaten in a considerable quantity it is very astringent. Brandy may be distilled from it. Captain Clerke endeavoured to preserve some; but they fermented, and became as strong as if they had been steeped in spirits. There were several plants which were serviceable to us, but are not used either by the Russians or natives, such as wild purslain; pea-tops; a kind of scurvy grass; cressies; and some others. On the low ground, and in the valleys is plenty of grass, which grows very thick, and to a great length. Among the inhabitants, native sulphur was seen, but we had no opportunity of learning where they got it. We found also ochre; a stone that gives a purple colour; and another that gives a very good green. In its natural state it is of a greyish green colour, coarse, and heavy. It dissolves easily in oil, but it entirely loses its properties when put into water. It seemed to be scarce in Oonalashka, but, we were told, it was in greater plenty in the island of Oonemak.

The inhabitants of Oonalashka bury their dead on the summits of hills, and raise a little hillock over their graves. There was one of these receptacles of the dead by the side of the road leading from the harbour to the village, over which was raised a heap of stones. It was observed that every one who passed it added one to it. In the country, we saw several stone hillocks, that seemed to have been raised by art; and many of them were apparently of great antiquity. These people are remarkably cheerful and friendly among each other; and always behaved with great civility to us. The Russians told us, that they never had any connections with their women, because they were not

Christians. Our people were not so scrupulous; and some of them had reason to repent that the females of Oonalashka encouraged their addresses without any reserve; for their health suffered by a distemper that is not unknown here.

We have had occasion to mention frequently, from the time of our arrival in Prince William's Sound, how remarkably the natives on this north-west side of America, resemble the Greenlanders and Esquimaux, in various particulars of person, dress, weapons, canoes, and the like. We were, however, much less struck with this, than with the affinity subsisting between the dialects of the Greenlanders and Esquimaux, and those of Oonalashka and Norton's Sound. But we must observe, with respect to the words which were collected by us on this side of America, that too much stress is not to be laid upon their being accurately represented; for, after the death of Mr. Anderson, we had few who took any great degree of pains about such matters; and we have often found that the same word, written down by two or more persons, from the mouth of the same native, differed considerably, on being compared together. Nevertheless, enough is certain to authorize this judgment, that there is great reason to suppose, that all these nations are of the same extraction; and if that be the case, there is little doubt of there being a northern communication by sea, between the western side of America, and the eastern side, through Baffin's Bay; which communication, however, is perhaps effectually shut up against ships, by ice, and other obstructions; such, at least, was Captain Cook's opinion at this time.

In these parts the tides are not very considerable, except in Cook's River. The flood comes from the S. or S. E. following the direction of the coast to the N. W. Between Cape Prince of Wales and Norton Sound we found a current setting towards the N. W. particularly off that Cape, and within Sledge Island. This current, however, extended but a little way from the coast, and was neither consistent nor uniform. To the N. of Cape Prince of Wales, we observed neither tide nor current, either on the coast of America, or that of Asia. This circumstance gave rise to an opinion, which some of our people entertained, that the two coasts were connected either by land or ice; and that opinion received some degree of strength, from our never having any hollow waves from the northward, and from our seeing ice almost the whole way across. From the several observations made during our continuance in the harbour of Samganoodha, its latitude is 53 deg. 5 min. N. and its longitude 193 deg. 29 min. 45 sec. E.

C H A P. XIII.

The Resolution and Discovery take their departure from Samganoodha Harbour, in the island of Oonalashka—Sandwich Islands the appointed place of rendezvous—Pass the island of Amoghta—The strait between Oonalashka and Oonella repassed—Run to the South—One man killed, and others wounded, on board the Discovery—Mowee, one of the Sandwich islands described—A visit from a chief, named Terreebooo—Another island, called Orebybee, discovered—The crew refuse to drink sugar-cane liquor—The cordage in the navy and merchants service compared—Favourable account of the natives of Orebybee—The Resolution gets to the windward of the island—Is joined by the Discovery—The two ships anchor in Karakakooa Bay, after it had been examined by Bligh—In the interim, multitudes of the islanders are seen, and visits received from many of them—Karakakooa Bay described—The ships surrounded by the natives—Despotic authority of the chiefs over them—A visit from Koob—The Morai at Kakooa described—Offering made to Captain Cook—Observatories erected—The ground on which they are placed tabooed—Method of curing meat in tropical climates.

ON Monday, the 26th of October, we sailed from Samganoodha harbour, when, the wind being southerly, we stood to the westward. The Commodore's intention was to proceed to Sandwich Islands, in order to pass a few of the winter months there, if we should meet with the necessary refreshments, and then direct our course to Kamtschatka, so as to endeavour to arrive there by the middle of May, in the ensuing year. This being determined on, the Commodore delivered into the hands of Captain Clerke instructions how to proceed in case of

separation, Sandwich Islands being appointed for the first place of rendezvous; and for the second, Petropaulowka, in Kamtschatka. Having got out of the harbour, the wind veered to the S. E. with which we were carried to the western part of Oonalashka, by the evening. We had here the wind at S. and stretched to the westward. On Tuesday the 27th, at seven o'clock A. M. we wore, and stood to the E. The wind had now so greatly increased, as to reduce us to our three courses. It blew in heavy squalls, accompanied with snow, hail, and rain. On the 28th, in the morning, Oonalashka

lashka bore S. E. four leagues distant. We now stood to the westward; but, towards evening, the wind, after it had for a short time abated, got insensibly to the N. E. increasing to a very hard gale, accompanied with rain: we therefore steered first to the southward, and then, as the wind inclined to the N. and N. W. more westerly. On Thursday the 26th, at half-past six, A. M. land was descried, supposed to be the island of Amoghta. At eight, finding it not in our power to weather the island, we gave over plying, and bore away, with the view of going to the N. of Oonalashka, not presuming in so hard a gale of wind to attempt a passage to the S. E. of it. When we bore away, the land extended from E. by S. half S. to S. S. W. distant four leagues. Our lat. was 53 deg. 38 min. and our long. 191 deg. 17 min. which gives a very different situation to this island from that assigned to it upon the Russian map; and Captain Cook was at a loss to determine whether it was Amoghta or not; but on the chart, Krenitzen's and Levasheff's voyage, in 1768 and 1769, an island called Amuckta is laid down, not very far from the place here assigned to Amoghta by Captain Cook. As we were steering to the N. E. at 11 o'clock we discovered a rock, elevated like a tower, bearing N. N. E. about four leagues distant, and situated in lat. 53 deg. 57 min. long. 191 deg. 2 min. This rock is not marked in the Russian map, produced by Ilmynloff; yet it has a place in the chart of Krenitzen's and Levasheff's voyage. That chart also agrees with Captain Cook's, as to the general position of this group of islands. The singularly indented shores of the island of Oonalashka, are represented in both charts nearly alike. These circumstances are worthy of notice, as the more modern Russian maps of this Archipelago are so exceedingly erroneous. At three in the afternoon, we had in view Oonalashka; upon which we shortened sail, and hauled the wind, being unable to run through the passage before night. Friday, the 20th, we had a very hard gale at W. N. W. with heavy squalls and snow, inasmuch that we were compelled to bear away under courses, and close-reefed top-sails. At noon, we were about the middle of the strait, between Oonalashka and Oonella, the harbour of Samganoodha, bearing S. S. E. one league distant. At three o'clock, P. M. we were through the strait, and clear of the isles, Cape Providence bearing W. S. W. distant three leagues.

On Sunday, the 1st of November, the wind was favourable, and we stood to sea. The weather was fairer than it had been at any time since we cleared Samganoodha Harbour, as it is called by the Russians, or Providence Bay, as it was named by Captain Cook. On the 2d, the wind was at S. and, in the evening, blew a violent storm, which occasioned us to bring to. Several guns were fired by the discovery, which we immediately answered. We lost sight of her at eight o'clock; nor did she join us till ten the next morning, being the 3d. On Saturday the 7th, in lat. 42 deg. 12 min. long. 201 deg. 26 min. E. a hawk, or cormorant, flew often round the ship. As it is not common for these kind of birds to go far from land, we concluded there might be some at no great distance, though we did not discover any. Having but little wind, Captain Clerke came on board with some melancholy intelligence. He informed us, that the second night after we had departed from Providence Bay, or Samganoodha, the main-tack of the Discovery gave way, by which accident John Mackintosh, seaman, was struck dead, and the boatswain, with three other mariners, much wounded. He added, that on the 3d, his ship having sprung a leak, and the rigging received considerable damage, he fired some guns as a signal for the Resolution to bring to. On the 8th we were favoured with a gentle breeze at N. attended with clear weather. On the 9th, we had eight hours calm; to which succeeded a wind from the S. accompanied with fair weather. Such of our people as could handle a needle, were now employed to repair the sails; and the carpenters were directed to put the boats in order. Thursday, the 12th, we observed in lat. 38 deg. 14 min. long. 206 deg. 17 min. The wind returned back to the northward; and on Sunday the 15th, in lat. 33 deg. 30 min. it veered to the E. We now saw a tro-

pic bird, and a dolphin, the first we had observed in our passage. On Tuesday, the 17th, the wind was southward, at which point it remained till the 19th, in the afternoon, when it was suddenly brought round by the W. to the N. The wind increased to a very strong gale, and brought us under double-reefed top-sails. We were now in lat. 32 deg. 26 min. long. 207 deg. 30 min. E. In lowering the main top-sail, in order to reef it, the violence of the wind tore it out of the foot-rope, and it was split in several parts. We got, however, another top-sail to the yard the next morning. This gale proved to be the forerunner of the trade-wind, which, in lat. 25 deg. veered to the E. and E. S. E. We steered to the southward till Wednesday, the 25th, when we were in lat. 20 deg. 55 min. On the 26th, at day-break, we discovered land, extending from S. S. E. to W. At eight o'clock we stood for it, when it extended from S. E. half S. to W. the nearest part being about two leagues distant. We now perceived that our discovery of the group of Sandwich islands had been very imperfect, those which we had visited in our progress northward, all lying to the leeward of our present station. An elevated hill appeared in the country, whose summit rose above the clouds. The land from this hill fell in a gradual slope, terminating in a steep rocky coast: the sea breaking against it in a most dreadful surf. Unable to weather the island, we bore up, and ranged to the westward. We now perceived people on many parts of the shore; also several houses and plantations. The country appeared to be well supplied with wood and water, and running streams were seen in various places, falling into the sea. It being of the utmost importance to procure a supply of provisions at these islands, which could not be accomplished, should a free trade with the natives be permitted; for this reason, the Commodore published an order, prohibiting all persons on board the ships from trading, except those that should be appointed by himself and Captain Clerke; and even these were under limitations of trading only for provisions and refreshments. Injunctions were also laid against admitting women into the ships, under certain restrictions; but the evil intended to have been prevented by this regulation, had already got amongst them. At noon, the coast extended from S. 81 deg. E. to N. 56 deg. W. A low flat, like an isthmus, bore S. 42 deg. W. the nearest shore being four miles distant. Our lat. was now 20 deg. 59 min. our long. 203 deg. 50 min. E. Some canoes came off, and when along-side, many of those who were in them, entered the ship without hesitation. We soon perceived that they were of the same nation as those islanders more to the leeward, whom we had already visited; and, as we understood, they were no strangers to our having been in these parts before. It was indeed too evident; these people having got the venereal disease among them, which they probably contracted by an intercourse with their neighbours, after we had left them. Our visitors supplied us with a quantity of cuttle-fish, in exchange for nails and iron. They brought but a small quantity of fruit or roots, but said they had plenty of them on their island, as well as of hogs and fowls. The horizon being clear, in the evening, we supposed the westernmost land that we could see to be an island, distinct from that off which we now were. Expecting the natives would return the next day, with the produce of their island, we plied off the whole night, and stood close in shore the next morning. We were at first visited by a few only, but towards noon numbers of them appeared, bringing with them potatoes, taro, bread-fruit, plantains, and small pigs; all of which were bartered for iron tools and nails, we having few other articles to give them. We made mutual exchanges till four in the afternoon, at which time they had disposed of all their cargoes, and not expressing any inclination to fetch more, we immediately made sail.

On Monday, the 30th, in the afternoon, being off the N. E. end of the island, some more canoes came off. Most of these belonged to Terreebooo, a chief, who came in one of them. He made the Commodore a present of three pigs; and we procured a little fruit by bartering

bartering with his people. In about two hours they all left us, except seven persons who chose to remain on board. Soon after, a double sailing canoe arrived to attend upon them, which we towed astern the whole night. In the evening, another island was seen to the windward, called, by the natives, Owhyhee. That which we had been off for some days, was called Mowee.

On Tuesday, the 1st of December, at eight o'clock A. M. Owhyhee extended from S. 22 deg. E. to S. 12 deg. W. and Mowee from N. 41 deg. to N. 81 deg. W. Perceiving we could fetch Owhyhee, we stood for it, when our visitors from Mowee thought proper to embark in their canoes, and went ashore. We spent the night, standing off and on the north side of Owhyhee. On the 2nd, in the morning, to our great surprize, we saw the summits of the mountains covered with snow. Though they were not of an extraordinary height, the snow, in some places, appeared to be of a considerable depth, and to have remained there some time. As we drew near the shore some of the natives approached us, who appeared a little shy at first; but we prevailed on some of them to come on board; and at length prevailed on them to return to the island to bring us such refreshments as we wanted. After these had reached the shore, we had plenty of company, who brought us a tolerable supply of pigs, fruit, and roots. We traded with them till six in the evening, when we stood off, in order to ply to windward round the island. In the evening of the 4th, an eclipse of the moon was observed. Mr. King used, for the purpose of observation, a night-telescope, with a circular aperture at the object end. The Commodore observed with the telescope of one of Ramsden's sextants. The mean of their observations made our longitude to be 204 deg. 35 min. E. Sunday, the 6th, in the evening, being near the shore, and five leagues farther up the coast, we again traded with the natives; but receiving only a trifling supply, we stood in the next morning, when the number of our visitors was considerable. We had now procured pork, fruit, and roots, sufficient to serve us four or five days; we, therefore, made sail, and still plied to the windward. Among other stores, the Commodore had procured a great quantity of sugar-cane; and having, upon trial, discovered, that a decoction of it made very palatable liquor, he ordered some of it to be brewed for our ship's service; but on broaching a cask thereof, not one of the crew would even taste it. Captain Cook having no other motive in preparing this beverage, than that of preserving our spirits for a colder climate, neither exerted his authority, nor had recourse to persuasion, to induce them to drink it, well knowing that, so long as we could be plentifully supplied with other vegetables, there was no danger of the scurvy. But that he might not have his intention frustrated, he ordered that no grog should be served in either of the two ships. The Commodore and his officers continued to drink this sugar-cane beer, whenever materials could be procured for brewing it. Some hops, which we had on board improved it much; and, it was, doubtless, extremely wholesome; though our inconsiderate crew, could not be persuaded, but it must be injurious to their health. About the beginning of this month, the crew of the Discovery being much in want of provisions, Captain Clerke, against his inclination, was under the necessity of substituting stock fish in the room of beef; but they were no sooner well in with the land, than they were visited by many of the inhabitants, who came off in their canoes, with all sorts of provisions, which their island afforded; and every man had leave to purchase what he could for his own indulgence. This diffused a joy among the mariners that is not easy to be expressed. From a fullness and discontent, visible in every countenance, all was cheerfulness, mirth and jollity. Fresh provisions and kind females are the sailors' sole delight; and when in possession of these, past hardships are instantly forgotten; even those whom the scurvy had attacked, and rendered almost lifeless, brightened up on this occasion, and for the moment appeared alert. We must here observe, that innovations, of whatever kind

on board a ship, are sure to meet with the disapprobation of the seamen, though even to their advantage. Our portable soup and four krout were condemned, at first, as improper food for human beings. Few commanders have introduced more useful varieties of food and drink into their ships than Captain Cook has done: few others, indeed, have had the opportunities, or have been driven to the necessity of trying such experiments. It was nevertheless, owing to certain deviations from established customs and practice, that he was enabled, in a great degree, to preserve his people from the scurvy, a distemper that has often made more havock in peaceful voyages, than the enemy in military expeditions.

Sunday, the 13th, having hitherto kept at some distance from the coast, we now stood in, six leagues more to the windward; and, after trading with such of the natives as came off to us, returned to sea. On the 15th, it was our intention to approach the shore again, with the view of procuring a fresh supply of fruit and roots; but the wind being then at S. E. by S. and S. S. E. we embraced the opportunity of stretching to the eastward, in order to get round the S. E. end of the island. The wind continued at S. E. the greatest part of the 16th; it was variable on the 17th, and on Friday the 18th, it was continually veering. Sometimes it blew in hard squalls; and, at other times, it was calm, with thunder, lightning, and rain. In the afternoon it was westerly for a few hours, but it shifted, in the evening to E. by S. The S. E. point of the island now bore S. W. by S. five leagues distant. We expected to have weathered it, but, on Saturday, the 19th, at one o'clock, A. M. we were left wholly at the mercy of a north-easterly swell, which drove us fast towards the land; so that long before day-break, lights were seen upon the shore, which was then distant about a league. It was a dark night, with thunder, lightning, and rain. The calm was succeeded by a breeze from the S. E. by E. blowing in squalls with rain. We stood to the N. E. thinking it the best tack to clear the coast; but had it been day-light, we should have chosen the other. At day-break, the coast extended from N. by W. to S. W. by W. about half a league distant; a most dreadful surf breaking upon the shore. We had certainly been in most imminent danger; from which we were not yet secure, the wind veering more easterly; so that for a considerable time, we were but just able to keep our distance from the coast. Our situation was rendered more alarming, by the leach-rope of the main-top-sail giving way, in consequence of which the sail was rent in two; and the top-gallant-sails gave way in the same manner, though not half worn out. We soon, however, got others to the yards, and left the land astern. The Discovery was at some distance to the north, entirely clear from the land; nor did she appear in sight till eight o'clock. Captain Cook here remarks, that the bolt ropes to our sails are extremely deficient in strength or substance. This, at different times, has been the source of infinite labour and vexation; and has occasioned much loss of canvas by giving way; from whence he concludes, that the cordage, canvas, and other stores, made use of in the navy, are inferior, in general, to those used in the merchants' service. The Commodore also observes, an opinion prevails among all naval officers, that the King's stores are superior to any others. They may be right, he admits, as to the quantity, but not as to the quality of the stores. This, indeed, he says, is not often tried; for these articles are usually condemned, or converted to other uses, before they are half worn out. Only such voyages as ours afford an opportunity of making the trial; our situation being such, as to render it necessary to wear every thing to the extreme. Captain Cook in this comparison of some cordage used in the King's service, with what is used in that of the merchants, may, in part, be right; especially in time of war, when part of the cordage wanted in the navy is, from necessity, made by contract. But it is well known, that there is no better cordage than what is made in the King's yards. This we assert, on the authority of a naval officer of distinguished rank, and great professional ability, who has, at the same time,

recommended

recommended it as a necessary precaution, that ships fitted out on discovery, should be furnished with no cordage but what is made in the King's yards; and, indeed, that every article of their stores, of every kind, should be the best that can be made.

When day-light appeared, the natives ashore displayed a white flag, we imagined, as a signal of peace and friendship. Many of them ventured out after us; but as the wind freshened, and we were unwilling to wait, they were left presently after. In the afternoon we made another attempt to weather the eastern extreme; in which we failed. Indeed, our getting round the island was a matter of no importance, for we had seen the extreme of it to the S. E. which was all the Commodore desired; the natives having informed us, that there was no other island to the windward of this. But as we were so near accomplishing our design, we did not entirely abandon the idea of weathering it, and continued to ply. On Sunday, the 20th, at noon, the S. E. point bore S. distant three leagues. The snowy hills bore W. N. W. and we were within four miles of the nearest shore. In the afternoon we were visited by some of the inhabitants, who came off in their canoes, bringing with them pigs and plantains: the latter were highly acceptable, we having been without vegetables for some days; but this supply was scarcely sufficient for one day; we therefore stood in the next morning, till within about four miles of the land, when a number of canoes came off, laden with provisions. The people continued trading with us till four o'clock in the afternoon, at which time having obtained a good supply, we made sail, stretching off to the northward. In our intercourse with the people of this island, we met with less reserve and suspicion, than we had ever experienced among any of the Indian tribes. They frequently sent up into the ship, the articles they meant to barter, and afterwards came in themselves, to traffic on the quarter deck. The inhabitants of Otaheite, whom we so often visited, had not that confidence in our integrity. It is but justice to observe, that the natives of Owhyhee never attempted to over-reach us in exchanges, nor to commit a single theft. They perfectly understood trading, and clearly comprehended the reason of our plying upon the coast: for though they brought off plenty of pigs, and other provisions, they were particular in keeping up the price, and rather than dispose of them at what they thought under the value, they would carry them to shore again.

Tuesday, the 22nd, at eight o'clock A. M. we tacked to the southward. At noon, in lat. 20 deg. 28 min. 30 sec. the snowy peak bore S. W. half S. the preceding day we had a good view of it, and the quantity of snow seemed to have increased, and to extend lower down the hill. We stood to the S. E. till midnight, when we tacked till four. We had hopes of weathering the island, and should have succeeded, if a calm had not ensued, and left us to the mercy of a swell, which impelled us towards the land, from which we were not above the distance of two leagues. Some light puffs of wind, however, took us out of danger. As we lay in this situation, some islanders came off with hogs, fowls, and fruit. From one of the canoes we got a goose, little larger than a Muscovy duck. The colour of its plumage was dark grey; the bill and legs were black. Having purchased what the natives had brought off, we made sail, and stretched to the north. At midnight we tacked and stood to the S. E. in order to examine the weathermost side of the island, where, we were told, there was a safe harbour. In this attempt the Discovery had her main-top-mast stay-sail split, and by continuing standing to the north, she lost sight of our ship, the Resolution. Heavy complaints again prevailed among her company. The weather continuing tempestuous, their sufferings on this account, from incessant labour, and scanty of provisions, were grown confessedly grievous. Their grog, that had been stopped at our arrival on the coast, was now dealt to them as usual, and it was only by the kindest treatment from their officers, that the men could be kept to their duty. On Thursday the 24th, at day-light, she was not

in sight, but, at this time, the weather being hazy, we thought she might be following us. At noon we observed in lat. 19 deg. 55 min. and in long. 205 deg. 3 min. the S. E. point of the island bearing S. by E. six leagues distant; the other extreme bore N. 60 deg. W. when we were two leagues from the nearest shore. In the evening at six o'clock, the southernmost part of the island bore S. W. the nearest shore being seven miles distant. We had, therefore, now succeeded in our endeavours, in getting to the windward of the island. The Discovery was not yet in sight, but as the wind was favourable for her to follow us, we expected she would shortly join us. We, therefore, kept cruising off this point of the island, till Captain Clerke was no longer expected here. It was at length conjectured, that he was gone to leeward, in order to meet us that way, not having been able to weather the N. E. part of the island. Keeping generally at the distance of from five to ten leagues from the land, one canoe only came off to us till the 28th, when about a dozen appeared, bringing, as usual, the produce of the island. We were concerned that the people had been at the trouble of coming, as we could not possibly trade with them, not having yet consumed our former stock; and we were convinced by experience, that the hogs could not be kept alive, nor the roots be many days preserved from putrefaction. It was our intention, however, not to leave this part of the island before we had procured a good supply, knowing we could not easily return to it, if it should hereafter be found expedient so to do. On Wednesday the 30th, we began to be in want, but a calm prevented us from approaching the shore. A breeze, however, sprung up at midnight, which enabled us to stand in for land, at day-break, of the 31st. At ten o'clock A. M. the islanders visited us, bringing with them a quantity of fruit and roots, but only three small pigs. This scanty supply was, perhaps, owing to our not having purchased what they lately brought off: yet, for the purposes of traffic, we brought to, but were interrupted shortly with an excessive rain; and, indeed, we were too far from the shore; nor could we venture to go nearer, as we could not, for a moment, depend upon the wind's continuing where it was. The swell too was extremely high, and set obliquely upon the shore, where it broke in a most frightful surf. We had fine weather in the evening, and passed the night in making boards.

On Friday, the 1st of January, the at- A. D. 1779. mosphere was laden with heavy clouds; and the New Year was ushered in with a heavy rain. We had a light breeze southerly, with some calms. At ten, the rain ceased, the sky became clear, and the wind freshened. Being now about four or five miles from the shore, some canoes arrived with hogs, fruit, and roots. We traded till three in the afternoon; when, being pretty well supplied, we made sail, in order to proceed to the lee side of the island, in search of the Discovery. We stretched to the eastward till midnight, when the wind favoured us, and we went upon the other tack. The 2nd, 3d, and 4th, we passed in running down the S. E. side of the island, standing off and on during the nights, and employing part of each day in lying to, in order to give the natives an opportunity of trading with us. They frequently came off, at the distance of five leagues from the shore; but never brought much with them, either from a fear of losing their articles in the sea, or from the uncertainty of a market. On Tuesday the 5th, in the morning, we passed the south point of the island, in lat. 18 deg. 54 min. beyond which the coast trends N. 60 deg. W. A large village is situated on this point, many of whose inhabitants thronged off to the ship with hogs and women. The latter could not possibly be prevented from coming on board; and they were less reserved than any females we had ever seen. Indeed, they seemed to have visited us with no other view than to make a tender of their persons. Having obtained a quantity of salt, we purchased only such hogs as were large enough for salting; refusing all those that were under size: and we could seldom procure any that exceeded the

A View of KARAKAKOOA, in OWYHEE

the weight of 60 pounds. Happily for us, we had still some vegetables remaining, as we were now supplied with but few of those productions. Indeed, from the appearance of this part of the country, it seemed incapable of affording them. Evident marks presented themselves of its having been laid waste by the explosion of a volcano; and though we had not seen any thing of the kind, yet the devastation it had made, in the neighbourhood, was very visible. The natives having now left us, we ran a few miles down the coast in the evening, and passed the night in standing off and on. The next morning, being Thursday the 7th, we were again visited by the natives. Being not far from the shore, Captain Cook sent Mr. Bligh, in a boat, in order to sound the coast, and also to go ashore, in search of fresh water. On his return, he reported, that, within two cables length of the shore, he found no soundings with a line of 160 fathoms; that, on the land, he could discover no stream or spring; that there was some rain-water in holes, upon the rocks, which the spray of the sea had rendered brackish; and, that the whole country was composed of flags and ashes, interspersed with a few plants. Between ten and eleven, to our great satisfaction, the *Discovery* made her appearance, coming round the south point of the island, and joined us about one. Captain Clerke came on board, and acquainted us, that having cruised four or five days where we were separated, he plied round the east side of the island; where meeting with tempestuous weather, he had been driven from the coast. He had one of the islanders on board all this time, who had refused to leave the ship, though opportunities had been in his favour. At noon we observed in lat. 19 deg. 1 min. long. 203 deg. 26 min. the nearest part of the coast being two leagues distant. On the 8th, at day-break, we perceived, that while we were plying in the night, the current had carried us back considerably to the windward; and that we were now off the S. W. point of the island, where we brought to, in order to enable the inhabitants to trade with us. We spent the night in standing off and on. Four men and ten women, who came on board the preceding day, were with us still. The Commodore not liking the company of the latter, we stood in shore on the 9th, about noon, solely with the view of getting rid of our guests; when some canoes coming off, we embraced the opportunity of sending them away.

On Sunday the 10th, in the morning, we had light airs from the N. W. and calms; at eleven, the wind freshened at N. N. W. which so greatly retarded us, that, in the evening, at eight o'clock, the fourth snowy hill bore 1 deg. 30 min. E. On the 11th, at four o'clock, A. M. the wind being at W. we made for the land, in expectation of getting some refreshments. The natives seeing us so near them, began to come off, and we continued trading with them the whole day: though we procured but a very scanty supply, many of those who came off in their canoes, not having a single thing to barter. From this circumstance, it appeared, that this part of the island was extremely poor, and had already furnished us with every thing they could spare. Tuesday the 12th, was employed in plying off and on, with a fresh gale at west. A mile from the shore we found ground, at the depth of 55 fathoms. At five o'clock P. M. we stood to the southward, and at midnight we had a calm. On the 13th, we had a small breeze at S. S. E. and steered for the land. A few canoes came off to us with some hogs; but they brought no vegetables, which we now much wanted. In the evening, we had got the length of the S. W. point of the island, but, by the veering of the wind, we lost in the night all that we had gained in the day. Being in the same situation on the 14th, in the morning, some more canoes attended us; but they brought not any articles we stood in need of. We were now destitute of fruit and roots, and therefore obliged to have recourse to our sea provisions. Several canoes, at this juncture, arrived from the northward, from whence we were supplied with some hogs and roots. On Friday, the 15th, we had variable light airs till five in the afternoon, when a breeze sprang up at E. N. E. and enabled us to steer

No. 70.

along shore to the northward. This day the weather was remarkably fine, and we had plenty of company; many of them continued with us all night, and their canoes were towed astern. On the 16th, at day-break, seeing the appearance of a bay, the boats from both ships were sent out to examine it; for we were informed there was a harbour, wherein we might safely moor, and where we should be supplied with materials to refit the ships, and provisions to victual them. In the evening the boats returned with the joyful news, that they had succeeded in their search, and that the harbour promised fair to answer all that had been said of it. While our boats were employed in towing the ships into the bay, we had a view of the greatest number of spectators in canoes, and on shore, that we had ever seen assembled together in any place during this voyage. It was concluded that their number could not be less than 2 or 3,000. While hovering on the coast, we had sometimes been visited by 200 canoes at a time, who came to trade, and who brought us provisions when the weather would permit: we likewise obtained from them great quantities of cordage, salt, and divers other manufactures of the island, which the Commodore purchased for the use of the ships, and without which we could not well have proceeded; for during the blowing weather, our cordage snapped rope after rope, so that our spare hands were employed incessantly, in knotting and splicing. In the course of this day, we were attended by, at least, 1,000 canoes, crowded with people, and laden with hogs, and other articles to barter. We were perfectly convinced of their peaceable intentions, not a single person having a weapon of any sort with him. Among such numbers as we had frequently on board, it might be expected, that some of them would discover a thievish disposition. One of them made off with a boat's rudder, and was not detected till it was too late to recover it. The Commodore imagined this to be a proper opportunity to shew these islanders the use of our fire arms. Two or three muskets, and as many four pounders were, by his orders, fired over the canoe which went away with the rudder: but it not being our intention, that the shot should take effect, the surrounding multitude were more surprized than terrified. At the approach of night, the most considerable part of our visitors retired to the shore; but many at their own earnest request, were permitted to sleep on board: but we had good reason to think, that curiosity, at least with some of them, was not the only motive; for the next morning several articles were missing, in consequence of which orders were given, not to permit so many to stay with us on any future night. On Sunday the 17th, by eleven o'clock A. M. we were safely moored, in company with the *Discovery*, in 18 fathoms water. The bay where we lay at anchor, called by the natives Karakakooa, is a convenient harbour; and having suffered much in our masts and rigging, we were happy at last to find so proper a place to refit. We cast anchor within a quarter of a mile of the N. E. shore; the south point of the bay bearing S. by W. and the north point W. half N. After we were moored the ships continued to be much crowded with the natives, and surrounded by a vast multitude of them, besides hundreds that, like fish, were swimming about the two ships. We were struck with the singularity of this scene, and particularly pleased with enriching our voyage, with this important new discovery, owing to the opportunity of thus revisiting Sandwich Islands, and in consequence of not having succeeded in finding a northern passage homeward.

The bay of Karakakooa is situated in the district of Akona, on the west side of the island of Owhyhee. It extends about a mile in depth, and is bounded by two points of land, bearing S. E. and N. W. from each other, at the distance of half a league. The north point is flat and barren, on which is situated the village of Kowrowa. A more considerable village stands at the bottom of the bay, called Kakooa, near a grove of stately cocoa-trees. A high rocky cliff, inaccessible from the sea shore, runs between them. Near the coast, on the south side, the land has a rugged appearance;

ance; beyond which the country rises gradually, and abounds with cultivated inclosures, and groves of cocoa-trees. The habitations of the people are scattered about in great plenty. Round the bay the shore is covered with a black coral rock, except at Kakooa, where there is an excellent sandy beach, with a Morai at one extremity, and a spring of fresh water at the other. The natives perceiving our intention to anchor in the bay, came off, as we have before observed, in astonishing numbers, expressing their joy by singing, shouting, and the most extravagant gestures. The decks, sides, and rigging of our ships were covered with them. Women and boys, who were unable to procure canoes, amused themselves the whole day in playing in the water. One of the chiefs who visited us, was named Parcea. Though a young man, we soon discovered him to be a person of great authority. He told Captain Cook that he was Jakanee to the sovereign of the island, who was then on a military expedition at Mowee; from whence he was expected to return in a few days. Some presents from the Commodore attached him to our interest, and we found him extremely useful. Before we had been long at anchor, the Discovery had so many people hanging on one side, that she was seen to heel considerably; and our people found it impossible to prevent the crowds from pressing into her. Apprehensive that she might receive some injury, Captain Cook communicated his sentiments to Parcea, who instantly cleared the ship of her incumbrances, and dispersed the canoes with which she was surrounded. From this circumstance it appeared to us, that the chiefs of this island exercise a most despotic power over the commonalty. An instance similar to this happened on board the Resolution; where the crowd so far impeded the ordinary business of the ship, that we found it necessary to apply to Kaneena, another chief, who had also attached himself particularly to Captain Cook. The inconvenience we suffered was no sooner mentioned, than he ordered the natives to quit the vessel immediately; when, without a moment's hesitation, we saw them all jump overboard, except one person who loitered behind, and by his manner expressed some degree of unwillingness to obey. Kaneena observing this contempt of his authority, took hold of him immediately, and threw him headlong into the sea. These two chiefs were exceedingly well proportioned, and had countenances remarkably pleasing. Kaneena was as fine a figure as we had ever seen. His height was about six feet, his features were regular and expressive, his deportment was easy, firm, and graceful, and he had lively dark eyes. Mention has already been made, that while we were cruising off this island, the inhabitants had acted fairly and honestly, without manifesting the least propensity to theft; which was the more remarkable, because those with whom we had hitherto had any dealings were people of the lowest rank, such as fishermen and servants: but the case was now quite altered. The multitude of islanders who blocked up the ships, afforded an opportunity of pilfering without danger of discovery, and even if discovered, must have escaped with impunity from our inferiority of number. To the encouragement of their chiefs, this alteration might also be attributed; for, as we frequently traced the booty to some great men who had it in their possession, there is little doubt but these depredations were made at their instigation. When the Resolution had got into her station, the two chiefs, Parcea, and Kaneena, brought a third on board, whose name was Koah. He was represented to us as a priest, and one who, in his early time of life, had distinguished himself as a warrior. He was a little old emaciated figure, having sore red eyes, and his body covered with a leprous scurf, occasioned by the immoderate use of the Ava. Being conducted to the cabin, he approached the Commodore with the greatest deference, threw a piece of red cloth over his shoulders, and retreating a few paces, made an offering of a small pig, at the same time pronouncing a discourse of a considerable length. This ceremony, during our continuance at Owhyhee, was often repeated, and, from a va-

riety of circumstances, appeared to us to be a kind of religious adoration. Red cloth is what their idols are arrayed with, and a pig is their common offering to the Eatooas. At the conclusion of this ceremony, Koah dined with us, and eat heartily of what was provided for the table; but, like most of the islanders in these seas, he could hardly be induced to taste our wine or spirits a second time. In the evening, the Commodore, Mr. King, and Mr. Bailey, accompanied him on shore. As soon as we landed on the beach, we were preceded by four men, bearing each a wand tipped with dog's hair, and pronouncing with a loud voice, a short sentence. The crowd which had assembled on the shore, retired at our approach, and not an individual was to be seen, except a few persons who had prostrated themselves on the ground, near the habitations of the adjacent village.

Previous to our account of the peculiar ceremonies respecting the homage paid to Captain Cook, it may not be unnecessary to describe the Morai, already mentioned, situated on the beach of Kakooa. It consists of a square solid pile of stones, 40 yards in length, 20 broad, and 14 feet high. The top of it is flat, and it is surrounded with a wooden railing, whereon are displayed the skulls of those natives who had been sacrificed on the death of their chiefs. A ruinous wooden building is situated in the center of the area, connected with the railing by a stone wall, dividing the whole space into two parts. Five poles, about 20 feet high, supported an irregular kind of scaffold, on the side next the country; and on that towards the sea, were two small houses, with a covered communication. To the top of this pile we were conducted by Koah. At our entrance we saw two large wooden images, with most distorted features, having a long piece of wood of a conical form, inverted, proceeding from the top of their heads. Here Captain Cook was received by a tall young man, having a long beard, who presented him to the images, and chanted a kind of hymn, in which he was assisted by Koah. We were then led to that side of the Morai where the poles were erected; at the foot of which 12 images were erected, and ranged in the form of a semicircle; the middle figure having a high table before it, like the Whatta of Otaheite, on which we saw a putrid hog, and under it some cocoa-nuts, plantains, potatoes, bread-fruit, and pieces of sugar-cane. Captain Cook was conducted under this stand by Koah; who, having took down the hog, held it towards him; when having again addressed him in a long and vehement speech, he suffered it to fall to the ground, and ascended the scaffold with him, though every moment in danger of falling. We now beheld, advancing in solemn procession, and entering the top of the Morai, ten men bearing a live hog, and a piece of red cloth of considerable dimensions. Advancing a few paces they stopped, and prostrated themselves; and Kaireekcea, the tall young man already mentioned, approaching them, received the cloth, and carried it to Koah, who wrapped it round the Commodore, and made him an offering of the hog. The Commodore was now aloft, in a situation truly whimsical, being swathed in red cloth, and hardly able to keep his hold on the rotten scaffolding. In this situation he was entertained with the chanting of Koah and Kaireekcea, sometimes alternately and sometimes in concert. After this service was performed, which was of considerable duration, Koah let the hog drop; upon which he immediately descended with Captain Cook. He then conducted him to the images just mentioned, to each of which he expressed himself in a sneering tone, and snapped his fingers at them as he passed. He then presented him to that in the centre, which, from its being habited in red cloth, appeared to be in the highest estimation. Before this figure Koah fell prostrate, and requested of Captain Cook to do the same; which he readily submitted to, being determined to follow Koah's directions throughout the whole of a ridiculous ceremony, in which his curiosity and vanity were equally gratified. We were now conveyed into the other division of the Morai, where a space of about 12 feet square was sunk three feet below the level of the area.

COOK OFFERING before CAPT. COOK, in One of the SANDWICH ISLANDS.

Engraved by J. G. W. & Co.

area. When we had descended into this, the Commodore was seated immediately between the two idols, one of his arms being supported by Koah, and the other by Mr. King. A second procession of natives at this time arrived with a baked hog, a pudding, some cocoa-nuts, bread fruit, and other vegetables. As they drew near, Kaireekkea placed himself before them, and presented the hog to the Commodore in the usual manner, chanting as before; and his companions making regular responses; but we observed their speeches and responses grew gradually shorter, and, towards the conclusion, Kaireekkea's did not exceed three or four words, which was answered by the word Orono. This was a common appellation among the natives. Sometimes it was applied by them to an invisible being, inhabiting heaven; at others it was used as a title of high rank in the island. At the conclusion of this offering, the natives seated themselves fronting us, and began to cut up the baked hog, to break the cocoa nuts, and to peel the vegetables. Others were employed in chewing the Ava, and making the liquor in the same manner as it is extracted and done at the Friendly Isles. Kaireekkea then chewed part of the kernel of a cocoa-nut, and wrapped it in a piece of cloth, with which he rubbed the Captain's head, face, hands, arms and shoulders. The Ava was afterwards handed round, and when we had all tasted it, Koah and Pareea pulled the flesh of the hog in pieces, and proceeded to put some of it in our mouths. Mr. King had no particular objection to being fed by Pareea, who was remarkably cleanly in his person; but Captain Cook, to whom a piece was presented by Koah, could not swallow a morsel, the putrid hog being strong in his recollection; and as the old man, from motives of civility, had chewed it for him, his reluctance was much increased. This ceremony being concluded, we quitted the Morai, after distributing among the populace some pieces of iron, and other articles, with which they were much delighted. We were then conducted, in procession, to the boats, the men with wands attending, and pronouncing sentences as before. We returned on board full of the idea of what we had seen, and perfectly satisfied with the honest dispositions of our new friends. Of the singularity and novelty of the various ceremonies performed upon this occasion, we can only form conjectures; but they were, in our opinion, highly expressive of respect, on the part of the inhabitants; and, as far as related to Captain Cook, they approached to adoration. Indeed the Commodore now seemed to be considered by them as their E-a-thu-ah-nu-ch; for from this time an Indian Chief, by the king's order, was placed at the head of his pinnace, at whose command the natives, in their canoes, as he passed them, were all silent, and would prostrate themselves till he was out of sight; and this they would do when the Captain was alone; but the chief had orders from the king, that whenever the Captain came ashore in his pinnace, to attend him, and conduct him to his house, which the sailors now called Cook's Altar.

On Monday, the 18th, Mr. King went on shore, attended with a guard of eight marines, having received orders to erect the observatory in a proper situation; by which means the waterers, and other working parties, on shore, might be superintended and protected. When we had found a convenient spot for this purpose, almost in the centre of the village, Pareea offered to exercise his power in our behalf, and proposed that some houses should be taken, that our observations might not be obstructed. This friendly offer, however, was declined, and we made choice of a potatoe field adjoining to the Morai, which was readily granted, and to prevent the intrusion of the natives, the place was consecrated by the priests, who placed their wands round the wall which enclosed it. This interdiction the natives call taboo, a term frequently repeated by these islanders, and seemed to be a word of extensive meaning. In this instance, it procured us more privacy than we could have wished. Not any canoes attempted to land near us;

the natives only sat on the wall, not daring to come within the tabooed space, without permission from us. The men, indeed, at our request, would bring provisions into the field; but our utmost endeavours were ineffectual to induce the women to give us their company. Presents were tried, but without success. We endeavoured to prevail on Pareea and Koah to bring them: the Eatooa and Terreeoboo they said would kill them if they did. This circumstance afforded great amusement to those on board, whither multitudes of people, women particularly, flocked in shoals, inasmuch that they were frequently obliged to clear the vessel, in order to have room to perform their necessary duties. Two or three hundred women were sometimes obliged to throw themselves into the water, where they continued to swim and play, till they could be re-admitted. On the 19th Pareea and Koah left us, in order to attend Terreeoboo, who had landed on a distant part of the island. Nothing material happened on board, till Sunday, the 24th. The caulkers were employed on the sides of the ship, and the rigging was repaired. The salting of hogs was also a principal object of the Commodore's attention; and as we had improved in this operation since the former voyages, a detail here of the process of it may not be thought improper. To cure the flesh of animals in tropical climates, by salting, has long been thought impracticable; putrefaction making so rapid a progress, as not to allow the salt to take effect before the meat gets tainted. Captain Cook appears to have been the first navigator who has attempted to make experiments relative to this business. His first attempts in 1774, in his second voyage to the Pacific Ocean, so far succeeded, as to convince him of the error of the vulgar opinion; and as his present voyage was likely to be protracted a year beyond the time that provisions had been supplied for the ships, he was obliged to contrive some method of procuring subsistence for the crews, or relinquish the prosecution of his discoveries. He therefore renewed his attempts, and his most sanguine expectations were completely answered. The hogs we cured were of various sizes, from four to ten or twelve stone, fourteen pounds to the stone. They were always killed in the afternoon; and, after scalding off the hair, and removing the entrails, the pig or hog was cut into pieces, from four to eight pounds each, and the bones taken out of the legs and chins; in the larger hogs, the ribs were also taken out. The pieces were then examined circumspectly, and wiped, and the coagulated blood taken from the veins. After this they were given to the salters before they were cold; and having been well rubbed with salt, they were placed in a heap on a stage in the open air, covered with planks, and pressed with very heavy weights. The next evening they were again well wiped, and carefully examined, when the suspicious parts were taken away. This done, they were put into a tub of strong pickle; after which they were examined once or twice a day; and if it happened that any one piece had not taken the salt, which may be discovered by the smell of the pickle, they were instantly taken out and examined again, the sound pieces being put into fresh pickle. This, however, did not often happen. At the end of six days, they were examined for the last time; and after being slightly pressed, they were put into barrels, having a thin layer of salt between them. Mr. King brought home some barrels of this pork, that had been pickled at Owhyhee, in January, 1779, which was tasted in England, near Christmas, 1780, by several gentlemen, who were all unanimous in their opinion, that it was perfectly sound, sweet, and wholesome food. We have been informed by Mr. Mancoover, a Midshipman on board the Discovery, and afterwards Lieutenant of the Martin sloop of war, that he tried the method here recommended, both with English and Spanish pork, during a cruise in the Spanish main, A. D. 1782, and it succeeded beyond his expectations.

WE had not long been settled at the observatory, before we discovered the habitations of a society of priests, who had excited our curiosity by their regular attendance at the Morai. Their huts were erected round a pond, inclosed with a group of cocoa-nut trees, by which they were separated from the beach and the village, and gave the situation an air of religious retirement. Captain Cook being made acquainted with this discovery, he resolved to visit them; and, expecting the manner of his reception would be singular, he took Mr. Webber with him, to enable him to represent the ceremony in a drawing. When arrived at the beach, the Commodore was conducted to Harreno-Oroño, or the house of Oroño. On his approaching this sacred place, he was seated at the foot of a wooden idol, resembling that we had seen at the Morai. Here Mr. King again supported one of his arms. He was then arrayed in red cloth, and Kaireekcea, assisted by 12 priests, presented a pig with the usual ceremonies. After this solemnity, the pig was strangled, and thrown into the embers of a fire, prepared for that purpose. When the hair was singed off, a second offering was made, and the chanting repeated as before; after which the dead pig was held some time under Captain Cook's nose, and then laid with a cocoa-nut at his feet. This part of the ceremony being concluded, the performers sat down; and the Ava was brewed and handed about: a baked hog was likewise brought in, and we were fed in the same manner as before related on a similar occasion. While we continued in the Bay, whenever the Commodore visited the observatory, Kaireekcea and his assistants presented themselves before him, making an offering of hogs, bread-fruit, cocoa-nuts, &c. with the accustomed solemnities. Upon these occasions, some of the inferior chiefs intreated permission to make an offering to the Oroño. If their request was complied with, they presented the hog themselves; in the performance of which, their countenances displayed that they were greatly impressed with awe and terror. Kaireekcea and the priests assisted, performing their accustomed orations and hymns. But their civilities extended beyond parade and ceremony: our party on shore were supplied daily by them with hogs and vegetables, sufficient for their subsistence, and to spare; and canoes laden with provisions, were regularly sent off to the ships. Nothing was demanded in return; not even the most distant hint was ever given, that they expected the least compensation. Their manner of conferring favours, appeared more like the discharge of a religious duty, than the result of mere liberality. On our asking to whom we were indebted for all this munificence, we were informed, that it was at the expence of Kaoo, the chief priest, and grandfather to Kaireekcea, who was at this time in the suit of the sovereign of the island. But we had less reason to be satisfied with the behaviour of the Earecs, or warrior chiefs, than with that of the priests. In our intercourse with the former, they were always sufficiently attentive to their own interests; and,

besides their propensity to stealing, which may admit of palliation from its universality in these seas, they had other artifices equally dishonourable. The following is one instance, in which we discovered, with regret, that our good friend Koah was a party principally concerned. The chiefs who made us presents of hogs, were always generously rewarded; in consequence of which, we were supplied with more than we could consume. On these occasions, Koah, who attended us constantly, petitioned usually for those that we did not absolutely want, and they were given him of course. A pig was one day presented to us by a man, whom Koah introduced as a chief. The pig we knew to be one of those that had a short time before been given to Koah. Suspecting an imposition, we found upon enquiry, that the pretended chief was one of the common people; and from other concurrent circumstances, we were perfectly convinced, that this was not the first time of our having been made the dupes of Koah's low cunning.

Sunday, the 24th, we were not a little surprized to find, that not any canoes were permitted to put off, and that the natives were confined to their houses. At length we were informed, that the Bay was tabooed, and that intercourse with us was interdicted, on account of the arrival of Terreeboob, their king. On the 25th, we endeavoured by threats and promises, to induce the inhabitants to revisit the ships. Some of them were venturing to put off, when we perceived a chief very active in driving them away: to make him desist, a musquet was fired over his head, which produced the desired effect; for refreshments were soon after to be had as usual. In the afternoon, the ships were privately visited by Terreeboob, attended only by one canoe, containing his wife and family. When he entered the ship, he fell on his face, as a mark of submission to the Commodore, as did all his attendants; and after having made an oration, which none of us understood, he presented the Captain with three barbecued hogs, who, in return, put a necklace, composed of several strings of various coloured beads, round his neck, and gave him two looking-glasses, a large glass bowl, with some nails, and other trifles, which he received with much seeming satisfaction, and dispatched immediately a messenger on shore, who soon returned with several large hogs, cocoa-nuts, plantains, and sugar-canes, as much as our small cutter could carry. Having remained on deck about an hour, admiring the construction of the ship, he was conducted into the great cabin, where wine was offered him, which he refused; neither was there any thing he would taste, except a head of bread-fruit; but he appeared delighted with every thing he saw; and before he departed in the evening, gave us to understand that he had 6000 fighting men, always in readiness to war against his enemies. On the 26th, at noon, the king came in great state from the village of Kowrowa, and, in a large canoe, with some of his attendants in two others, paddled slowly towards the ships. Their appearance was really most superb. Terreeboob, and his chiefs were in the first vessel, arrayed

CAMBRIDGE
LIBRARY

rayed in feathered cloaks, and helmets, and armed with spears and daggers. In the second came Kaoo, the chief priest, having their idols displayed on red cloth. They were figures of an enormous size, made of thick wicker-work, and curiously ornamented with mantles of feathers of various colours. Their eyes were large pearl oysters, with a black nut placed in the middle. A double row of the fangs of dogs was fixed in each of their mouths, which, as well as the rest of their features, appeared strangely distorted. The third canoe was laden with hogs and vegetables. Their images they call E-ah-tu-a, signifying their warrior gods, without which they never engage in battle. As they advanced, the priests chanted their hymns with great solemnity. After paddling round the vessels, they did not come on board as we expected, but made immediately towards the shore, at the beach where our tents were fixed. When landed, they hauled up all their canoes on the beach, drew up in martial order, and, led by the king, marched in ranks to their place of worship, distant from our tents about 50 yards; but, seeing the ground tabooed by small green boughs and wands, that marked the boundary, they all made a circuit with their images in procession, till they arrived at their Morai, where they placed their idols, and deposited their arms. Captain Cook, when he saw the king's intention of going on shore, went thither also, and landed with Mr. King and others, almost at the same instant. We ushered the chiefs into our tent, and the king had hardly been seated, when he rose up, and threw gracefully over the Captain's shoulders the rich feathered cloak that he himself wore, placed a helmet on his head, and presented him with a curious fan. Five or six other cloaks, of great beauty and value, were spread at the Commodore's feet. Four hogs were now brought forward by the king's attendants, together with bread fruit, &c. Then followed the ceremony of Terreeoboo's changing names with Captain Cook; the strongest pledge of friendship among all the islanders of the Pacific Ocean. A solemn procession now advanced, consisting of priests, preceded by a venerable old personage, followed by a train of people leading large hogs; others being laden with potatoes, plantains, &c. We could perceive easily, by the countenance and the gestures of Kaireekkea, that the old man who headed the procession, was the chief priest, on whose bounty we were told we had so long subsisted. He wrapped a piece of red cloth round the shoulders of Captain Cook, and in the usual form, presented him with a pig. He was then seated next the king, and Kaireekkea and their attendants began their vocal ceremonies, Kaoo and the chiefs assisting in the responses. In the person of this king, we were surprised to recognize the same emaciated old man, who came on board the *Resolution*, from the N. E. side of the island of Mowee; and we perceived that several of his attendants were the same persons, who at that time continued with us the whole night. Among these were the king's two youngest sons, the elder about the age of sixteen; and Maiha-Maiha, his nephew, whom we could not immediately recollect, having had his hair plastered over with a dirty paste and powder, which was no small improvement to the most savage countenance we had ever seen. The formalities of this meeting being ended, Captain Cook conducted Terreeoboo and several of his chiefs on board our ship, where they were received with every possible mark of attention and respect; and the Commodore, as a compensation for the feathered cloak, put a linen shirt upon the sovereign, and girt his own hanger round him. Kaoo, and about half a dozen other ancient chiefs, remained on shore. All this time not a canoe was permitted to remain in the Bay, and those natives who did not confine themselves to their huts, lay prostrate on the ground. Before the king quitted the *Resolution*, he granted leave for the natives to trade with us as usual; but the women, we know not on what account, were still interdicted by the taboo; that is, to remain at home, and not have any kind of intercourse with us. At this time the behaviour of the inhabitants was so civil and inoffensive, that all apprehensions of danger were totally vanished. We trusted ourselves among them at

No. 71.

all times, and upon all occasions, without the least reserve. Our officers ventured frequently up the country, either singly, or in small parties, and sometimes continued out the whole night. In all places the people flocked about us, anxious to afford every assistance in their power, and appeared highly gratified if we condescended to accept of their services. Variety of innocent arts were practised to attract our notice, or to delay our departure. The boys and girls ran through their villages, stopping us at every opening where there was a convenient spot for dancing. At one time we were solicited to take a draught of milk from cocoa-nuts, or to accept of such other refreshment as their huts afforded; at another we were encircled by a company of young women, who exerted their skill and ingenuity in amusing us with songs and dances: but though the instances of their generosity and civility were pleasing to us, we could not but dislike that propensity to thieving, which at times they discovered, and to which they were addicted, like all the other islanders in these seas: this was a perplexing circumstance, and obliged us sometimes to exercise a severity, which we should have been happy to have avoided, if it had not been essentially necessary. Some expert swimmers were one day detected under the ships, drawing out the filling nails from the sheathing. This they performed very ingeniously with a flint stone, fastened to the end of a stick. This new art of stealing was a practice so injurious to our vessels, that we fired small shot at the offenders; but that they avoided easily, by diving under the ship's bottoms: it therefore became highly necessary to make an example of one of them, which was done by giving him a good flogging on board our consort, the *Discovery*, where his talent for thieving had been chiefly exercised. About this time, Mr. Nelson, and four other gentlemen, set out on an excursion into the country, in order to examine its natural curiosities and productions, an account of which will be given hereafter. This afforded Kaoo a fresh opportunity of testifying his civility, and exerting his friendly disposition in our favour: for no sooner was he informed of the departure of our party, than he sent after them a large quantity of provisions, with orders that every attention and assistance should be granted them by the inhabitants of those districts through which they should pass. His civility on this occasion was so delicate and disinterested, that even the people he employed were not permitted to accept of the smallest present. At the end of six days the gentlemen returned, without having been able to penetrate farther than twenty miles into the island, owing partly to improper guides, and partly to the nature of the country, which occasioned this expedition to be attended with no small fatigue, and some danger. Mr. Nelson, however, collected a curious assortment of indigenous plants, and some natural curiosities. During their absence, every thing remained quiet at the tents, and the natives supplied the ships with such quantities of provisions, of all kinds, that orders were again given to purchase no more hogs in one day, than could be killed, salted, and stowed away the next day. This order was in consequence of a former one, to purchase all that could be procured for sea stock, by which so many of them were brought on board, that several of them died before they could be properly disposed of.

On Wednesday, the 27th, in the morning, the rudder of our ship was unhung, and sent on shore, in order to undergo a thorough repair. The carpenters at the same time were sent into the country, under the protection and guidance of some of Kaoo's people, to get planks for the head rail work, which was become rotten and decayed. In a visit, on the 28th, from Terreeoboo to Captain Clerke, the latter received a present of 30 large hogs, and such a quantity of vegetables as could not be consumed by his crew in less than a week. This being an unexpected visit, made it the more extraordinary. Not having seen any of the sports or exercises of the natives, at our particular request, they entertained us in the evening with a boxing match. A vast concourse of people assembled on a level spot of ground, not far distant from our tents. In the centre, a

7 H

long

long vacant space was left for them, at the upper end of which the arbitrators presided, under three standards. Slips of cloth of various colours, were pendant from these standards; as were the skins of two wild geese, some small birds, and a few bunches of feathers. The sports being ready to begin, the judges gave the signal, and two combatants appeared in view. They advanced slowly, drawing up their feet very high behind, and rubbing their hands upon the soles. As they came forward, they surveyed each other frequently from head to foot, with an air of contempt, looking archly at the spectators, distorting their features, and practising a variety of unnatural gestures. When they were advanced within the reach of each other, they held both arms straight out before their faces, at which part they always aimed their blows. They struck with a full swing of the arm, which to us had a very awkward appearance. They did not attempt to parry; but endeavoured to elude their adversary's attack, by slooping, or retreating. The battle was decided expeditiously; for if either of them fell, whether by accident, or from a blow, he was deemed vanquished; and the victor expressed his triumph by a variety of strange gestures, which usually excited a loud laugh among the spectators, for which purpose it seemed to be calculated. The successful combatant waited for a second antagonist; and, if again victorious, for a third; and so on, till at last he was defeated. In these combats it was very singular, that, when any two are preparing to attack each other, a third may advance, and make choice of either of them for his antagonist, when the other is under the necessity of withdrawing. If the combat proved long and tedious, or appeared unequal, a chief generally interfered, and concluded it by putting a stick between the combatants. As this exhibition was at our desire, it was universally expected, that some of us would have engaged with the natives; but, though our people received pressing invitations to bear a part, they did not hearken to the challenges, not having forgot the blows they received at the Friendly Islands.

This day died William Watman, a mariner of the gunner's crew. This event we mention particularly, seeing death had hitherto been uncommon among us. He was a man in years, and much respected by Captain Cook. He had served twenty-one years as a mariner, and then entered as a seaman in 1772, on board the *Resolution*, and served with the Commodore in his voyage towards the South Pole. On their return he got admittance into Greenwich Hospital, at the same time with himself; and anxious to follow the fortunes of his benefactor, he also quitted it with him, on the Commodore's appointment to the command of the present expedition. Watman had often been subject to slight fevers, in the course of the voyage, and was very infirm when we arrived in the bay; where, having been sent a few days on shore, he thought himself perfectly restored, and requested to return on board. His request was complied with. The day following he had a stroke of the palsy, which in two days afterwards put an end to his life. At the request of Terrecoboo, the remains of this faithful seaman were buried in the Morai; the ceremony being performed with great solemnity. Kaoo and his brethren were present at the funeral, who behaved with great decorum, and paid due attention while the service was performing. On our beginning to fill up the grave, they approached it with great awe, and threw in a dead pig, together with some cocoa-nuts and plantains. For three successive nights they surrounded it, sacrificing hogs, and reciting prayers and hymns till morning. At the head of the grave, we erected a post, and nailed thereto a piece of board, whereon was inscribed the name and age of the deceased, and the day of his departure from this life. These memorials we were assured they would not remove, and, it is probable, they will be permitted to remain, so long as such frail materials can endure.

Being much in want of fuel, Captain Cook desired Mr. King to treat with the priests, for the purchase of the railing belonging to the Morai. Mr. King had his doubts respecting the decency of this overture, and ap-

prehended the proposal might be deemed impious; but in this he was much mistaken: for an application being made for the same, they expressed no kind of surprize, and the wood was delivered without the least stipulation. While our people were taking it away, Mr. King saw one of them with a carved image; and, upon enquiry, he was informed, that the whole semicircle (as mentioned in the description of the Morai) had been carried to the boats. Though the natives were spectators of this business, they did not seem to resent it; but on the contrary, had even assisted in the removal. Mr. King thought proper to mention the particulars to Kaoo; who seemed exceedingly indifferent about the matter, begging him only to restore the center image; which was immediately done, and it was conveyed to one of the priest's houses.

For some time, the king, and his chiefs, had been very importunate to know the time of our departure. From this circumstance, Mr. King's curiosity was excited to know the opinion these people had entertained of us, and what they supposed to be the object of our voyage. He took considerable pains to satisfy himself respecting these points; but the only information he could get was, that they supposed we had left our native country on account of the scantiness of provisions, and that we had visited them for the sole purpose of filling our bellies. This conclusion was natural enough, considering the meagre appearance of some of our crew; the voracity with which we devoured their fresh provisions; and our anxiety to purchase as much of it as we were able. It was a matter of entertainment to see the natives patting the bellies of the sailors (who were much improved in sleekness since their arrival at the bay) and telling them, in the best manner they could, that it was time for them to depart; but if they would return the next bread-fruit season, they should be better able to supply them. We had now continued sixteen days in the bay, during which time our consumption of hogs and vegetables, had been so enormous, that we need not be surprized at their wishing to see us take our leave. But Terrecoboo had, perhaps, no other view, in his enquiries, than a desire of having sufficient notice, to prepare suitable presents for us at our departure; for when we informed him of our intention to quit the island in two days, a kind of proclamation was made, requiring the natives to bring in their hogs, and vegetables, for Terrecoboo to present to the Orono.

We were this day much entertained, at the beach, with the buffooneries of one of the natives. He held in his hand an instrument of music, such as we have already described: bits of sea-weed were fastened round his neck; and, round each leg, some strong netting; whereon were fixed rows of dogs teeth, hanging loose. His dancing was accompanied with strange grimaces, and unnatural distortions of the features, which were sometimes highly ridiculous, and, upon the whole, without meaning or expression. But the wrestling and boxing matches afforded us good diversion for the evening; and, in return, we exhibited the few fire-works we had remaining. Nothing could more effectually excite the admiration of these islanders, or strike them with more exalted ideas of our superiority, than such a representation: notwithstanding this was, in every respect, much inferior to that exhibited at Hapace, yet the astonishment of these people was equally great.

The carpenters who had been sent up the country to cut planks for the head rail-work of our ship, the *Resolution*, had now been gone three days, and, not having heard from them, we began to be alarmed for their safety. We expressed our apprehensions to Kaoo, who appeared equally concerned with ourselves; but while we were planning measures with him, for sending proper persons after them, they all safely arrived. Our people had gone farther into the country than they expected, before they found any trees suitable for their purpose. This circumstance, together with the badness of the roads, and the difficulty of conveying timber to the ships, had so long detained them. They bestowed high commendations on their guides, who not only

only supplied them with provisions, but faithfully protected their tools. Having fixed on Thursday, the 4th of February, for our departure, Terrecoboo invited Captain Cook, and Mr. King, to attend him on the 3d, to Kaoo's residence. On our arrival there, we saw large quantities of cloth scattered on the ground; abundance of red and yellow feathers, fastened to the fibres of cocoa-nut husks; and plenty of hatchets and iron ware, which had been received from us in barter. Not far from these was deposited an immense quantity of various kinds of vegetables; and at a little distance, a large herd of hogs. We supposed, at first, that the whole was intended as a present for us; but we were informed by Kaircekea, that it was a tribute to the king, from the inhabitants of that district. We were no sooner seated than the bundles were brought, and laid severally at Terrecoboo's feet; and the cloth, feathers, and iron, were displayed before him. The king was perfectly satisfied with this mark of duty from his people; and having selected about one third of the iron utensils, one third of the feathers, and some pieces of cloth, he ordered these to be set aside by themselves; and the remainder of the cloth, hogs, vegetables, &c. were afterwards presented to Captain Cook and Mr. King. The value and magnitude of this present, far exceeded any thing that we had before received. The whole was immediately conveyed on board; and the large hogs were set apart for sea stores; but the smaller pigs and vegetables, were divided between the crews. The same day we quitted the Morai, and got our observatories on board. The taboo was removed, and, with it vanished its magical effects; for as soon as we had quitted the place, the people rushed in, and vigilantly searched, in hopes of finding some valuable articles left behind. Mr. King being the last on shore, and waiting for the return of the boat, the inhabitants crowded about him, and having prevailed upon him to sit down among them, expressed their regret at our separation. It was even with difficulty that they would suffer him to depart. Having had, while we lay in the bay, the command of the party on shore, he became more acquainted with the natives, than those who were required to be on board. From the inhabitants in general, he experienced great kindness; but the friendship shewn by the priests was constant and unbounded. On the other hand, Mr. King was anxious to conciliate their esteem; in which he so happily succeeded, that when they were made acquainted with the time of our departure, he was urged to remain behind; and received overtures of the most flattering kind. When he endeavoured to excuse himself, by alleging, that the Commodore would not permit it, they proposed to conduct him to the mountains, and there conceal him till the departure of the ships. On Mr. King's assuring them that the ships would not sail without him, the King and Kaoo repaired to Captain Cook, (whom they supposed to be his father) requesting formally, that he might be suffered to remain behind. The Commodore unwilling to give a positive refusal, to a proposal so generously intended, assured them, that he could not part with him at present, but he should return thither the next year, when he would endeavour to oblige them.

On Thursday the 4th of February, early in the morning, having unmoored, the Resolution and Discovery set sail, and cleared the harbour, attended by a vast number of canoes. We proposed to shape our course for Mowee; as we had been informed, that in the island there was a fine harbour, and excellent water, but Captain Cook intended to finish first the survey of Owhyhee, before he went thither, hoping to meet with a road more sheltered than Karakakooa Bay. We had not been long under sail, when the king, who had omitted to take his leave of Captain Clerke, as not expecting our departure to be so sudden, came after the ships, accompanied by the young prince, in a sailing canoe, bringing with them ten large hogs, a great number of fowls, and a small turtle (a great rarity) with bread-fruit in abundance. They also brought with them great quantities of cocoa-nuts, plantains, and sugar-canes. Besides other persons of distinction, who accompanied

the king, there was an old priest, who had always shewn a particular attachment to Captain Clerke, and who had not been unrewarded for his civility. It being rather late when they reached the Discovery, they staid on board but a few hours, and then all departed, except the old priest, and some girls, who had the King's permission to remain on board, till they should arrive at some of the neighbouring isles. We were now steering with a fine breeze, but just at the close of evening, to our great mortification, the wind died away, and a great swell succeeding, with a strong current setting right in for shore, we were in the utmost danger, particularly the Discovery, of being driven upon the rocks. At this time the old priest, who had been sent to sleep in the great cabin, leaped over-board unseen with a large piece of Russian silk, Captain Clerke's property, and swam to shore.

On Friday the 5th, we had calm weather, and made but little way. Seeing a large canoe between us and the shore, we hove to for her coming up, and to our great surprize perceived the old king, with several of his chiefs, having with them the priest who had stolen the silk, bound hand and foot, whom the king delivered to Captain Clerke, at the same time requesting that his fault might be forgiven. The king being told his request was granted, unbound him, and set him at liberty; telling the Captain that, seeing him with the silk, he judged it was not his own, therefore ordered him to be apprehended; and had taken this method of exposing him, for having injured his friend. This was a singular instance of justice, which we did not expect to see among these people. As soon as they had delivered the silk, which the king refused to accept, they departed. Having a light breeze in the night, we made a little progress to the northward.

On Saturday the 6th, in the morning, we were abreast of a deep bay, called by the natives Toc-yah-yah. We flattered ourselves with finding a commodious harbour here; for we saw some fine streams of water to the N. E. and the whole appeared to be well sheltered. These observations seeming to tally with the accounts given by Koah, who was now on board the Resolution, the master was sent in the pinnace, with Koah as his guide, to examine the bay; but, before they set off, Koah altered his name, out of compliment to us, to that of Briannee. In the afternoon, the weather became gloomy, and such violent gusts of wind blew off the land, that we were obliged to take in all the sails, and bring to, under the mizen-stay-sail. Soon after the gale began, all the canoes left us; and Mr. Bligh, on his return, preserved an old woman and two men from drowning, whose canoe had been overset in the storm. We had several women remaining on board, whom the natives, in their hurry to depart, had left to shift for themselves. Mr. Bligh reported, that he had landed at a village on the north side of the bay, where he was shewn some wells of water, that would not, by any means answer our purpose; that he proceeded farther into the bay; where, instead of finding good anchorage, he observed the shores to be low, and a flat bed of coral rocks extended along the coast, and upwards of a mile from the land; the depth of water, on the outside, being twenty fathoms. During this survey Briannee had contrived to slip away. His information having proved erroneous, he might, perhaps, be afraid of returning. In the evening the weather became more moderate, when we again made sail; but it blew so violently about midnight, as to split the fore and main-top sails.

On Sunday the 7th, in the morning, we bent fresh sails. Being now about four or five leagues from the shore, and the weather very unsettled, the canoes would not venture off, so that our female guests were under the necessity of remaining with us, though, at this time, much against their inclination; for they were all exceedingly sea sick, and many of them had left their infants on shore. The weather continued squally, yet we stood in for land, in the afternoon; and being within three leagues of it, we saw two men paddling towards us. We conjectured, that they had been driven off

the shore, by the late boisterous weather; and therefore stopped the ship's way, in order to take them in. These poor wretches were so exhausted by fatigue, that had not one of the natives on board jumped into the canoe to their assistance, they would hardly have been able to fix it to the rope thrown out for that purpose. It was with great difficulty that we got them up the ship's side, together with a child about four years of age, which had been lashed under the thwarts of the canoe, with only its head above the water. They had left the shore the morning before, and had been, from that time, without food or water. The usual precautions were taken in giving them victuals, and the child being committed to the care of the women, they were all perfectly recovered by the next morning. At midnight a gale of wind coming on, we were obliged to double reef the top-sails, and get down the top-gallant yards.

On Monday the 8th, at day-break, we found that the fore-mast had again given way; the fishes being sprung, and the parts so very defective, as to make it absolutely necessary to unstep the mast. Captain Cook for some time hesitated, whether he should return to Karakakooa, or take the chance of finding a harbour in the islands to the leeward. The bay was not so commodious, but that a better might probably be met with, either for repairing the masts, or procuring refreshments; the latter of which, it was imagined, the neighbourhood of Karakakooa had lately been pretty well drained of. It was, on the other hand, considered, as an imprudent step, to leave a tolerable good harbour, which, once lost, could not be regained, for the mere possibility of meeting with a better; especially, as the failure of such a contingency, might have deprived us of any resource. We now stood on towards the land, to give the natives on shore an opportunity of releasing their friends on board; and, about noon, when we were within a mile of the shore, several canoes came off to us, but so loaded with people, that no room could be found for any of our guests; the pinnace was therefore hoisted out to land them; and the master who commanded it, was instructed to examine the south coasts of the bay for water, but returned without success. Variable winds, and a strong current to the northward, retarded their return.

On Tuesday the 9th, at eight o'clock, A. M. it blew very hard from the S. E. which occasioned us to close reef the top-sails.

On Wednesday the 10th, at two o'clock, A. M. in a heavy squall, we found ourselves close in with the breakers, to the northward of the west point of Ohwyhee. We had just room to avoid them, and fired several guns to alarm the Discovery, and apprise her of danger. In the forenoon, the weather had been more moderate. A few canoes ventured to come off to us, when we were informed by those belonging to them, that much mischief had been occasioned by the late storms, and that a great many canoes had been lost. We kept beating to windward the remainder of the day; and, in the evening, were within a mile of Karakakooa bay; but we stood off and on till day-light, the next morning, when we cast anchor in our old station.

On Thursday the 11th, and part of the 12th, all hands were employed in getting out the fore-mast, and conveying it on shore. Besides the damage which the head of the mast had sustained, the heel of it was found by the carpenters, exceeding rotten, having a large hole in the middle. As the necessary repairs were likely to take up several days, Mr. Bayly and Mr. King got the astronomical apparatus on shore, and pitched their tents on the Morai, guarded by a corporal and six marines. A friendly intercourse was renewed with the priests, who, for our greater security, tabooed the place with their wands as before. The sail-makers were sent on shore to repair the damages, in their department, sustained by the late heavy gales. They occupied a house adjoining to the Morai, that was lent us by the priests. Such were the arrangements on shore. But on coming to anchor in the bay, our reception was so very different from what it had been upon our first ar-

rival, that we were all astonished: no shouts were heard, no bustle or confusion, by the motions of the natives, were perceived; but we found ourselves in a solitary, deserted bay, with hardly a friend appearing, or a canoe stirring. Their curiosity, indeed, might be supposed to be diminished by this time; but the hospitable treatment we had been continually favoured with, and the friendly manner in which we parted, induced us to expect that, on our return, they would have received us with the greatest demonstrations of joy. Various were our conjectures on the cause of this extraordinary appearance, when our anxiety was in part relieved by the return of our boat, the crew of which brought us intelligence, that Terreecobo was absent, and that the bay was tabooed. This account appeared very satisfactory to many of our company; but some were of opinion, that there was, at this time, somewhat very suspicious in the behaviour of the natives; and that the taboo, or interdiction, on pretence of the king's absence, was contrived artfully, to afford him time to consult his chiefs, in what manner we should be treated. Whether those suspicions were well founded, or the account given by the natives was the truth, we were never able to ascertain. For though it is not improbable, that our sudden return, for which they could see no apparent cause, and the necessity of which we afterwards found it very difficult to make them comprehend, might occasion some alarm; yet the unsuspicious conduct of Terreecobo, who, on his supposed arrival, the next morning, came immediately to visit Captain Cook, and the consequent return of the natives to their former friendly intercourse with us, are strong proofs that they neither meant, nor apprehended, any change of conduct. In support of this opinion, we may add the account of another accident, precisely of the same kind which happened to us, on our first visit, the day before the king's arrival. A native having sold a hog on board our ship, and received the price agreed on, Pareea, who saw the transaction, advised the seller not to part with his hog, without an advanced price. For his interference in this business, he was harshly spoken to, and pushed away; and as the taboo was soon laid on the bay, we, at first, supposed it to be the consequence of the affront offered to the chief. Both these events serve to shew how extremely difficult it is to draw any certain conclusion from the conduct of a people, with whose language and customs we were so imperfectly acquainted. Some idea, however, may be formed of the difficulties those have to encounter, who in their intercourse with these strangers, are obliged to steer their course in the midst of uncertainties, when the most serious consequences may be expected by only imaginary offences. However true or false our conjectures may be, it is certain this day, the 12th, things went on in their usual quiet course.

On Saturday the 13th, at the approach of evening, the officer who commanded the watering party of the Discovery, came to inform Mr. King, that several chiefs were assembled near the beach, and were driving away the natives, who assisted the sailors in rolling the casks to the shore; declaring, at the same time, that their behaviour seemed to be very suspicious, and he imagined they would give him some farther disturbance. Mr. King, agreeable to his request, sent a marine with him, but permitted him to take only his side arms. The officer, in a short time, returned, and informed Mr. King, that the inhabitants had armed themselves with stones, and were become very tumultuous. Mr. King therefore went himself to the watering place, attended by a marine with his musquet. Seeing them approach, the islanders threw away their stones, and, on Mr. King's application to some of the chiefs, the mob was dispersed. Every thing being now quiet, Mr. King went to meet Captain Cook, who was coming on shore in the pinnace. He related to the Commodore all that had recently happened, and received orders to fire ball at the offenders, should they again behave insolently, and in case of their beginning to throw stones. In consequence of these orders Mr. King commanded the corporal to give directions, that the sentinels

pieces should be loaded with ball, instead of shot. On our return to the tents, we heard a continued fire of the muskets from the Discovery, which we observed to be directed at a canoe, that we saw paddling towards the shore, in great haste, and pursued by one of our small boats. We immediately concluded, that the firing was in consequence of some theft, and Captain Cook ordered Mr. King to follow him with a marine armed, and to endeavour to seize the people as they came on shore. Accordingly, we ran towards the place where we imagined the canoe would land, but were too late; the people having quitted it, and made their escape into the country before our arrival. We were at this time ignorant, that the goods had been already restored; and thinking it probable, from the circumstances we had at first observed, that they might be of importance, for this reason, we were unwilling to relinquish our hopes of recovering them. Having therefore enquired of the natives which way the fugitives had gone, we followed them, till it was near dark, when judging ourselves to be three miles from the tents, and suspecting that the natives, who frequently encouraged us in the pursuit, were amusing us with false information, we thought it in vain to continue our search any longer, and therefore returned to the beach. During our absence a difference of a more serious nature had happened. The officer who had been dispatched in the small boat after the thieves, and who was returning on board with the goods that had been restored, seeing Captain Cook and Mr. King engaged in the pursuit of the offenders, seized a canoe which was drawn upon the shore. This canoe belonged to Pareea, our friend, who at that instant, arriving from on board the Discovery, claimed his property, and protested his innocence. However, the officer persisted in detaining it, in which he was encouraged by the crew of the pinnace, then waiting for the Commodore. The consequence of this imprudent conduct was, what might have been expected: a scuffle ensued; and Pareea unfortunately was knocked down, by a violent blow on the head with an oar. Several of the natives, who had hitherto been unconcerned spectators, began now to attack our people with such a shower of stones, that they were compelled to make a precipitate retreat, and swam off to a rock, at a considerable distance from the shore. The pinnace was plundered immediately by the natives, and would have been entirely demolished, had not Pareea interposed, who had not only recovered from his blow, but had also forgot it at the same instant. He ordered the crowd to disperse, and beckoned to our people to come and take possession of the pinnace; and afterwards assured them, that he would use his influence to get the things restored which had been taken out of it. After their departure, he followed them in his canoe, carrying them a midshipman's cap, and some other articles; and expressing much concern at what had happened, begged to know, if the Orono would kill him? And, whether he might be permitted to go on board the next day? He was assured that he would be well received; upon which he joined noses with the officers (their usual token of amity) and paddled over to Kowrowa. When these particulars were related to Captain Cook, he was exceedingly concerned; and when the Captain and Mr. King were returning on board, the former expressed his fears, that these islanders would oblige him, though much against his inclination, to use violent measures with them; adding, they must not be permitted to suppose that they had gained an advantage over us. It was too late to take any steps this evening, the Commodore therefore only gave orders, that every native should be immediately turned out of the ships. This order having been executed, Mr. King returned to his station on shore; and the events of the day having much abated our former confidence in the natives, we posted a double guard on the Morai, with orders to send to Mr. King and let him know, if any of the natives were seen lurking about the beach. At 11 o'clock, five of the natives were seen creeping round the bottom of the Morai: they approached silently with great caution, but, perceiving they were discovered, immedi-

ately retired out of sight. At midnight, one of them ventured very near the observatory, when one of the sentinels fired over him; whereupon he, with some others, fled with great precipitation, and we had no farther molestation during the remainder of the night. The temper of these islanders was now totally changed; and for some days past, as may be seen from our journal, they became more and more troublesome. In the course of this day, several parties of them were busy in rolling stones from the edge of the hill, with a view, as was supposed, to annoy the ships; but these were at too great a distance to receive any damage; however, the Commodore looking upon this as an insult, ordered some of our great guns to be fired among them, and, in less than ten minutes, not an Indian was to be seen near the place. In the afternoon Terreeoboo came on board, and complained of our having killed two of his people, intimating, at the same time, that they had not the least intention of hurting us. He continued on board near two hours, amusing himself with seeing our armourers work, and requested that they might be permitted to make him a pahooa (an instrument used in battle, when they come to close quarters) which was immediately done.

Sunday, the 14th of February, 1779. This is that memorable day, in which are comprized the affecting incidents, and melancholy particulars, that concluded with the assassination of our beloved and honoured Commodore. Very early in the morning, a party of the islanders were perceived, who made a great lamentation, and moved slowly along to the beating of a drum, that gave scarcely a stroke in a minute. From this circumstance our people supposed, they were burying the dead who had been killed the preceding day. At day break Mr. King repaired on board the Resolution, in order to examine the time-keeper. In his way thither, he was hailed by the Discovery, and received the alarming information, that their cutter had been stolen, in some time of the night, from the buoy, where it was moored. The boat's painter had been cut two fathoms from the buoy, and the remainder of the rope was gone with the boat. This gave cause sufficient to suspect that some villany was hatching by the islanders, and that ill consequences would follow such a daring theft. With these thoughts Mr. King hastened on board the Resolution, whose whole company were by this time in motion. On his arrival, he found the marines arming, the crew preparing to warp the ship nearer to the shore, and Captain Cook loading his double barrel gun. He began with a relation of what had happened in the night at the Morai, when the Commodore interrupted him with some eagerness, and informed him of the loss of the Discovery's cutter, and of the preparations he was making to recover it; adding, that he was resolved to seize Terreeoboo, and to confine him on board till the boat should be returned. It had been Captain Cook's usual practice, in all the islands of the Pacific Ocean he had visited, whenever any thing of consequence had been stolen by the natives, to get their king, or some of the principal eares on board, where he detained them as prisoners, till the property that had been lost was restored; and this method having hitherto proved successful, he meant to pursue it on the present occasion. In consequence of this hasty determination, the Commodore gave orders to stop every canoe that should attempt to leave the bay; having resolved to seize, and destroy them, if the cutter could not be recovered by lenient measures. To this end the boats of both ships, properly manned and armed, were stationed across the bay. The islanders observing our motions, and seeing the ships warping towards the towns, of which there were two, one on each side of the harbour, they concluded that our design was to seize their boats. In consequence of which conjecture, most of their large war canoes took the alarm, and were making off, when our guns, loaded with grape and canister shot, drove them back.

Between the hours of seven and eight o'clock, Captain Cook and Mr. King quitted the ship together; the former in the pinnace, having Mr. Phillips, and nine marines

marines with him; and the latter in a small boat. The last orders Captain Cook gave Mr. King, were, to quiet the minds of the people on his side of the Bay, by the strongest assurances that they should not be injured; to keep his people together, and to be continually on his guard. Captain Cook and Mr. King then parted; the former intending to proceed to Kowrowa, where Terreeboob resided, and the latter to the beach. When Mr. King had landed, he perceived many of the warriors of Owwhyee were clothed in their military mats, though without arms; that they were gathering together in a body from every direction; and that they assumed a very different countenance to what they usually wore upon all former occasions; he therefore, when arrived at his station on shore, issued strict orders to the marines, to continue within the tent, to charge their muskets with ball, and not, on any consideration, to quit their arms. This done, he waited upon old Kaoo, and the priests, at their respective huts, and explained to them, as well as he was able, the reason of the hostile preparations, which had so exceedingly alarmed them. He found they were no strangers to our loss of the cutter, and assured them, that though the Commodore was resolved not only to recover it, but to punish, in the most exemplary manner, the perpetrators of the theft; yet they, and all the inhabitants of the village, on our side, need not be alarmed, nor apprehend the least danger from us. He desired the priests to communicate the motives by which we were actuated in our present conduct, to the people, and to intreat them not to entertain groundless fears, but, confiding in our declarations, to remain peaceable and quiet. Mr. King having thus made known our real intention, Kaoo asked, with great emotion, if Terreeboob, the king, was to be hurt? Mr. King declared he was not; upon which both Kaoo and the rest of the priests seemed much satisfied with this assurance.

In the interval of these transactions, Captain Cook having called off the launch from the N. part of the Bay, and taken it with him, landed, regardless of appearances, at Kowrowa, with Mr. Phillips, lieutenant of the marines, a serjeant, and nine privates. He proceeded immediately into the village, where he was received respectfully; the people, as usual, prostrating themselves before him, and making their accustomed offerings of small hogs; but it was observed, that the chiefs were in some consternation on seeing the Captain and his guard, and that they soon disappeared one after another. The Commodore perceiving that his main design was not suspected, the next step he took was, to enquire for the king, and the two boys, his sons, who had been his constant guests on board the *Resolution*. In a short time the boys returned, with some of the natives who had been sent in search of them; and conducted Captain Cook to the habitation where Terreeboob had slept. The old king had just awoke, and the Captain addressed him in the mildest terms; assuring him, that no violence was intended against his person, or any of his people; but only against those who had been guilty of a most unprecedented act of robbery, by cutting from her moorings one of the ship's boats, without which they could neither conveniently water, nor carry on the necessary communication with the shore; requiring of the king, at the same time, to give orders for the cutter to be restored without delay; and requesting his company with him on board, till his orders should be carried into execution. Terreeboob, in reply, protested his total ignorance of the theft; said he was very ready to assist in discovering the author of it, and should be glad to see him punished; but he shewed great unwillingness to trust his person with those who had lately exercised unusual severities against his people. He was told, that the tumultuous appearance of his people, and their repeated depredations, made some uncommon severities necessary; but that not the least hurt should be done to the meanest inhabitant of his island by any person belonging to the ships; and all that was necessary for the continuance of peace, was, to pledge himself for the honesty of his people. With that view, and that only, he came to request the king

to place confidence in him, and to make the *Resolution* his home, as the most effectual means of putting a stop to the robberies that were daily and hourly committed by his people, both at the tents, and on board the ships, and which were now so daring as to become insufferable. The king upon this remonstrance arose, and accepted the invitation.

In about half an hour Terreeboob set out with Captain Cook, to attend him on board; and every thing had a prosperous appearance. The two boys were already in the pinnace, and the rest of the party were approaching the water-side; when a woman, named Kannee-kabereea, the mother of the boys, and one of Terreeboob's favourite wives, followed him, and with many tears and intreaties besought him not to venture on board. At the same time, two warriors who came along with her, laid hold of the king, insisting he should proceed no farther, and obliged him to sit down. A large body of the islanders had by this time got together, who had probably been alarmed by the discharging of the great guns, and the hostile appearances in the bay. They now began to behave outrageously, and to insult the guard. Thus situated, Mr. Phillips, Lieutenant of the marines, perceiving that his men were huddled together in the crowd, consequently unable to use their arms, should there be a necessity for so doing, proposed to the Commodore to draw them up along the rocks, close to the edge of the water; upon which the Lieutenant received orders to march, and, if any one opposed, to fire upon, or instantly dispatch him; but the natives readily making way for them to pass, Mr. Phillips drew them up in one line, within about thirty yards of the place where Terreeboob was sitting. The old king continued all this time on the ground. His eyes diffused gloomy discontent; his head drooped, and his whole countenance was impressed with every mark of terror and dejection; as if he was possessed with a foreboding consciousness of the catastrophe, in the bloody tragedy that was now about to be acted. Captain Cook, unwilling to abandon the object which occasioned him to come on shore, urged him most earnestly to proceed: but, on the other hand, if the king appeared inclined to attend him, the surrounding chiefs interposed: at first they had recourse to entreaties; but afterwards to force and violence, and even insisted on his remaining on shore; and the word was given, that Tootee was about to carry off their king, and to kill him.

Captain Cook, at length, finding that the alarm had spread too generally, and being sensible that there was not a probability of getting Terreeboob off without much bloodshed, thought it most prudent to give up the point; observing to Mr. Phillips, that it would be impossible to compel the king to go on board, without running the risk of killing a great number of the inhabitants. Thus the enterprize was abandoned by Captain Cook; nor did it appear, that his person was in the least degree of danger, till an accident happened, the report of which brought forth in an instant a number of warriors from the crowd, and occasioned a fatal turn to the whole affair. The boats stationed across the Bay, having fired at some war canoes, for attempting to get out, had unfortunately killed one of their principal chiefs. Intelligence of his death arrived at the spot where the Commodore then was, just as he had parted from the king, and was walking slowly towards the shore. The ferment it occasioned was immediately too conspicuous; the women and children were immediately lent away, and the men soon put on their war mats, and armed themselves with spears and stones. One of the natives having provided himself with two of these missile weapons, advanced towards Captain Cook, flourishing a long iron spike, or pahooa, in defiance, and threatening to throw the stone. The Captain made signs for him to desist, but the man persisting in his insolence, and repeating his menaces with strange grimaces, he was provoked to fire a charge of small shot at him; but the warrior being defended by his mat, which the shot could not penetrate, this served only to irritate and encourage the islanders, whose fighting men

An Exact Representation of the DEATH of Capt. JAMES COOK, N.B. at Kaulakakooa Bay, in OWHYHEE, on Feb. 14, 1779.

now pushed forward, throwing whole volleys of stones at the marines. One of the chiefs attempted to stab Mr. Phillips with his pahooa, (some say the very same that was made by our armourers, at the request of the king, the day before) but not succeeding in his attempt, he received from him a blow with the butt end of his musquet. A general attack with stones succeeded, and the quarrel became general. On our side, the guns from the ships began to pour in their fire upon the multitude of natives, as did likewise the marine guard, and those from the boats; nevertheless, though the slaughter among the islanders was great, yet, enraged as they were, they stood an incessant fire with astonishing intrepidity; and, without giving time for the marines to charge again, they rushed in upon them with horrid shouts and yells. What followed was a scene of horror and confusion, which can more easily be conceived than related. Four of the marines, corporal Thomas, and three privates, namely, Hinks, Allen, and Fadget, retreated among the rocks, and fell victims to the fury of the enemy. Three others were dangerously wounded; and the Lieutenant, who had received a stab between the shoulders with a pahooa, having fortunately reserved his fire, shot the man who had wounded him, just as he was going to repeat his blow. The last time our Commodore was distinctly seen, he was standing at the water's edge, ordering the boats to cease firing, and pull in; when a base assassin, coming behind him, and striking him on the head with his club, felled him to the ground, in such a direction, that he lay with his face prone in the water. A general shout was set up by the islanders on seeing the Captain fall, and his body was dragged on shore, where he was surrounded by the

enemy, who, snatching the dagger from each other's hands, displayed a savage eagerness to join in his destruction. It should seem that their vengeance was directed chiefly against our Commodore, by whom they supposed their king was to be dragged on board, and punished at discretion; for, having secured his body, they fled without much regarding the rest of the slain, one of whom they threw into the sea.

Thus ended the life of the greatest navigator that this or any other nation could ever boast of: who led his crews of gallant British seamen twice round the world; reduced to a certainty the non-existence of a Southern continent, about which the learned of all nations were in doubt; settled the boundaries of the earth and sea; and demonstrated the impracticability of a N. W. passage from the Atlantic to the great Southern Ocean, for which our ablest geographers had contended, and in pursuit of which vast sums had been spent in vain, and many valuable mariners had miserably perished. His death was doubtless premature; yet he lived to accomplish the great undertaking for which he seemed particularly designed. How sincerely his loss was lamented, (we speak here in the language of his panegyrist) by those who owed their security to his skill and conduct, and every consolation to his tenderness and humanity, it is impossible to describe; and the task would be equally difficult to represent the horror, dejection, and dismay, which followed so dreadful and unexpected a catastrophe. Let us therefore turn from so mournful a scene, to the pleasing contemplation of his virtues, character, and public services, the history of which our readers will find in the subsequent chapter.

C H A P. XV.

Memoirs of the life and public services of Captain James Cook—His birth and parentage—Education and early situation in life—His inclination for the sea, and first employment in the merchant's service—Tries his fortune in His Majesty's ship, the Eagle—Is made a Lieutenant—His behaviour under Sir William Barnaby, and when engaged in the active scenes of the war in America—His appointments, by the recommendations of Lord Colville and Sir Hugh Palliser—His first voyage to the South Seas—His second, to complete the discovery of the Southern hemisphere—His third and last voyage, in order to discover a North West passage—An account of his family, and their pensions—Observations on his character and death—Particulars which happened subsequent to his death—Bravery of Lieutenant Phillips—The islanders forced to retire—Situation of our party at the Morai—Annoyed by stones—An attempt to storm the Morai—Quitted by our people—A short truce, and pacific measures adopted—Mr. King sent to obtain a conference with some of the chiefs of Owhyhee—His interview with Koah—Contemptuous behaviour of the natives, and precautions taken on our side—A part of Captain Cook's body brought—Further provocations from the natives—Our watering parties harassed with stones—The village of Kakooa burned—Instance of bravery in one of the natives—A procession headed by Kairekeca—The bones of Captain Cook brought on board—They are committed to the deep with the usual funeral ceremonies.

HAVING related the untimely fate of our excellent Commander, Captain Cook, we now proceed to give our readers some new and authentic particulars of the life of this great navigator; the whole, we will venture to affirm, making a more correct and complete historical narrative, on so interesting a subject, than has hitherto appeared in any edition whatever of Captain Cook's voyages, under whatever authority published, or however pompously set forth.

The late Captain James Cook, the subject of these memoirs, was born at Marton, in the North Riding of Yorkshire, on February the 3d, 1728. In this particular, we may contradict the ignorant assertions foisted on the public by editors of publications of the like kind with this; but we rest our credibility on the authority of the Rev. Mr. Grenside, whose certificate, taken from the register of births in his parish, is now in the possession of our publisher. The father of Captain Cook was a day labourer to a farmer, and lived in a small village surrounded with mud walls; who afterwards removed to Great Ayton; where he was employed as a peasant by the late Thomas Scuttowe, Esq. with whom he was assisted by young Cook, his son, in the different branches of husbandry. At the age of 13, this youth was put under the tuition of Mr. Pullen, a schoolmaster of Ayton, by whom he was instructed in

the arts of writing, common book-keeping, &c. and he is said to have shewn an uncommon genius in his application to the several rules of vulgar arithmetic. In January, 1745, at the age of 17, his father bound him apprentice, to learn the grocery and haberdashery business, at Snaith; but his natural inclination not having been consulted on this occasion, he soon quitted the counter in disgust, after a year and a half's servitude; and having contracted a strong propensity to the sea, his master, willing to indulge him in following the bent of his inclination, gave up readily his indentures. In July, 1746, he was bound apprentice to Mr. Walker, of Whitby, for the term of three years, which time he served to his master's full satisfaction. Under him he first sailed on board the ship *Freelove*, employed chiefly in the coal trade from Newcastle to London. In the spring of 1750, Mr. Cook shipped himself as a seaman on board the *Maria*, under the command of Captain Gafkin; in which vessel he continued all that year, in the Baltic trade. In 1753, he entered on board His Majesty's ship the *Eagle*; "having a mind," as he expressed himself, "to try his fortune that way." Some time after, the *Eagle* sailed with another frigate on a cruise, in which they were very successful.

In the year 1758, we find this rising mariner, master of the *Northumberland*, the flag ship of Lord Colville, who

who had then the command of a Squadron stationed on the coast of America. It was here, as he has often been heard to say, that, during a hard winter, he first read Euclid, and applied to the study of the mathematics and astronomy, without any assistance than what a few books, and his own industry afforded. At the same time, that he thus found means to cultivate his understanding, improve his mind, and supply the deficiencies of a nearly education, he was engaged in most of the busy and active scenes of the war in America. At the siege of Quebec, Sir Charles Saunders committed to his charge the execution of services, of the first importance in the naval department. He piloted the boats to the attack of Montmorency; conducted the embarkation to the heights of Abraham, examined the passage, and laid buoys for the security of the large ships in proceeding up the river. The courage and address with which he acquitted himself in these services, gained him the warm friendship of Sir Charles Saunders and Lord Colville, who continued to patronize him during the rest of their lives, with the greatest zeal and affection.

On the 1st of April 1760, he received a commission as a lieutenant, and soon after a specimen of those abilities, which recommended him to the commands, in the execution whereof he so highly displayed his merit, that his name will be handed down to posterity, as one of the most skilful navigators which this country hath produced. In 1765 he was with Sir William Barnaby, on the Jamaica station; and behaved in such a manner as gained him the approbation of the admiral. At the conclusion of the war, he was appointed, through the recommendation of Lord Colville, and Sir Hugh Palliser, to survey the Gulph of St. Lawrence, and the coasts of Newfoundland. In this employment he continued till the year 1767, when the Royal Society resolved, that it would be proper to send a navigator into the South Seas, to observe the Transit of the planet Venus over the Sun's disk; and Otaheite being fixed upon, the Endeavour, a ship built for the coal trade, was put into commission, and the command of her given to Lieutenant, the late Captain Cook, who was appointed with Mr. Charles Green to observe the Transit. In this voyage he was accompanied by Joseph Banks, Esq. since Sir Joseph, and Dr. Solander, and other ingenious artists. The Transit of Venus was observed in different parts of the island, and the Captain returned, after having been absent almost three years, in which period he had made discoveries equal to all the navigators of his country, from the time of Columbus to the present. From this period, as his services increased in usefulness to the public, so his reputation advanced to a height too great for our encomiums to reach. Perhaps no science ever received greater additions from the labours of a single man, than geography has done from those of Captain Cook; who, in his first voyage to the South Seas discovered the Society Isles; determined the insularity of New Zealand; discovered the straits which separate the two islands, called after his name; and made a complete survey of both. He afterwards explored the eastern coast of New Holland, hitherto unknown; an extent of 27 deg. of lat. or upwards of 2,000 miles.

Soon after the Captain's return to England, it was resolved to equip two ships to complete the discovery of the Southern hemisphere. It had long been a prevailing idea, that the unexplored part contained another continent. To ascertain the fact was the principal object of this expedition; and that nothing might be omitted that could tend to facilitate the enterprise, two ships were provided; the one, the Resolution, under the command of Captain Cook; the other, the Adventure, commanded by Captain Furneaux. In this second expedition round the world, Captain Cook resolved the great problem of a southern continent; having so completely traversed that hemisphere, as not to leave a possibility of its existence, unless so near the pole, as to be beyond the reach of navigation. In this voyage New Caledonia, the largest island in the Southern Pacific Ocean, except New Zealand, was discovered; as was also the island of Geor-

gia; and an unknown coast, which the Captain named Sandwich land; and having twice visited the tropical seas, he settled the situations of the old discoveries, and made several new ones.

The want of success which attended Captain Cook's attempt to discover a Southern Continent, did not set aside another plan which had been recommended some time before. This was no other than the finding out a N. W. passage, which the fancy of some chimerical projectors had conceived to be a practicable scheme. His services were required for this arduous undertaking, and he offered them without hesitation. This third and last voyage is distinguished by the extent and importance of its discoveries. Not to mention several smaller islands in the Southern Pacific, Captain Cook discovered the group, north of the equinoctial line, called Sandwich Islands; which, on account of their situation and productions, may perhaps become an object of more consequence, than any other discovery in the South Sea. He explored what had remained before unknown of the western coast of America, an extent of 3700 miles; ascertained the proximity of the two continents of Asia and America; sailed through the straits between them, and surveyed the coasts on each side, so far as to be satisfied of the impracticability of a passage in that hemisphere, from the Atlantic into the Pacific Ocean, by an eastern or western coast. In short, he completed the hydrography of the habitable globe, if we except the Japanese Archipelago, and the sea of Amur, which are still known imperfectly by Europeans. Throughout this voyage it must be confessed, that his services as a navigator, are important and meritorious. The methods which he invented, and so successfully put in practice, of preserving the health, (and consequently the lives) of seamen, will transmit his name to future ages, as a friend and benefactor of mankind. It is well known among those who are conversant in naval history, that the advantages which have been fought, through the medium of long sea voyages, have always been purchased at a dear rate. That dreadful disorder which is peculiar to this service, must, without exercising an unwarrantable degree of tyranny over our seamen, have been an insuperable obstacle to our enterprises. It was reserved for Captain Cook to convince the world, that voyages might be protracted to three, or even four years, in unknown regions, and under every change of climate, without affecting the health, in the smallest degree, and even without diminishing the probability of life. A few months after his departure from England, notwithstanding he was then absent, the Royal Society voted him Sir Godfrey Copley's gold medal, as a reward for the account, which he had transmitted to that body, of the method taken to preserve the health of the crew of his ship. Captain Cook was a married man, and left several children behind him. On each of these his Majesty has settled a pension of twenty-five pounds a year, and two hundred pounds per annum on his widow.

The constitution of this great and unparalleled navigator, was robust both by nature and habit; his body having been inured to labour, and rendered capable of undergoing the severest hardships. His stomach bore, without complaining, the most coarse and ungrateful food. Indeed he submitted, with an easy self-denial, to wants of every kind, which he endured with remarkable indifference. The qualities of his mind were of the same hardy vigorous kind with those of his body. His understanding was strong and quick-sighted; his judgment, in whatever related to the services he was engaged in, quick and sure: his designs were bold and daring, yet manly and discreet. His courage was cool and determined, and accompanied with an admirable presence of mind, in the moment of danger. His manners were plain and unaffected.

Some have censured his temper as subject to hastiness and passion; but let it be considered, that these were counteracted, and frequently disarmed, by a disposition benevolent and humane. There are those who have blamed Captain Cook for his severity to the natives of different islands which we visited; but it was

not to these alone he was severe in his discipline. He never suffered any fault in his own people, though ever so trivial, to escape unpunished. If they were charged with insulting a native, or injuring him in his property, if the fact was proved, the offender seldom escaped unpunished. By this impartial distribution of equal justice, the natives themselves conceived so high an idea of his wisdom, and his power too, that they paid him the honours bestowed on their Eatooa, or good spirit.

This is certain, that a most distinguishing feature in Captain Cook's character was, that unremitting perseverance in the pursuit of his object, which was not only superior to the opposition of dangers, and the profusion of hardships, but even exempt from the want of ordinary relaxation. During the three long voyages in which he was engaged, his eagerness and activity were never in the least abated. No incidental temptation could detain him for a moment; even those intervals of recreation, which sometimes occurred unavoidably, and were looked for by us with a longing that persons who have experienced the fatigues of service will readily excuse, were submitted to by him with a certain impatience, whenever they could not be employed in making further provisions for the prosecution of his designs. In the course of this work, we have faithfully enumerated all the particular instances in which these qualities were displayed, during the great and important enterprizes in which he was engaged: and we have likewise stated the result of those services, under the two principal heads to which they may be referred, those of geography and navigation, each of which we have placed in a separate and distinct point of view.

We cannot close these memoirs, without taking a slight retrospect view of the tragical end of this truly great and worthy sea officer. It was imagined by some of those who were present, that the marines, and those who were in the boats, fired without Captain Cook's orders, and that he was anxious to prevent the farther effusion of blood; it is therefore probable, that, on this occasion, his humanity proved fatal to him; for it was observed, that while he faced the natives, no violence had been offered him; but when he turned about to give directions to the boats, he immediately received the fatal blow. Whether this was mortal or not it is impossible for any one to determine; but we are informed by a gentleman on board the *Discovery*, whose veracity is unquestionable, that there was time sufficient to have secured the body of our brave Commander, had a certain lieutenant, who commanded a boat of the same ship, pulled in, instead of making off. We do not mention the name, but if our information is an undeniable fact, the daftardly officer merits justly that contempt and poverty, to which it is said he is at present reduced. We beg leave further to observe, that the natives had certainly no intention at first of destroying Captain Cook, or any of his party. The cause first originated in the death of the *Eree*, who was shot by one of our people in the boat: it was this circumstance which alarmed them, and, in consequence of this it was that they armed themselves. At this period Captain Cook might have returned on board with safety; but he was unfortunate in missing the man who behaved insolent to him, and shooting another; he was unfortunate in the firing of the marines; and equally so in the firing of the people in the launch; all which happened in the space of a few minutes. In short, all the causes that brought on the death of this much lamented Circumnavigator, were produced by a chain of events which could no more be foreseen than prevented. His memory we leave to the gratitude and admiration of posterity.

We now proceed to relate those particulars, that have come to our knowledge, and which happened subsequent to the death of Captain Cook. We have before observed, that four of the marines, who accompanied the Commodore, were killed by the natives; the survivors, with Mr. Phillips, their lieutenant, threw themselves into the sea, and made their escape, being protected by a smart fire from the boats. On this occa-

sion, a striking instance of gallant behaviour, and of affection for his men, was displayed by Mr. Phillips: for he had scarcely got into the boat, when, seeing one of the marines, who was not a very expert swimmer, struggling in the water, and in danger of being taken by the islanders, he instantly leaped into the sea to his assistance, though considerably wounded himself; and after receiving a blow on his head from a stone, which had almost sent him to the bottom, he caught the marine by the hair, and brought him off in safety. Our people for some time kept up a constant fire from most of the boats (which, during the whole transaction, were at no greater distance from the land than twenty yards), in order to afford their unfortunate companions, if any of them should still remain alive, an opportunity of effecting their escape. These efforts, seconded by a few guns, that were, at the same time, fired from the *Resolution*, having at length compelled the enemy to retire, a small boat, manned by five midshipmen, pulled towards the shore, where they perceived the bodies lying on the ground without any signs of life. However, they judged it dangerous to attempt to bring them off with so inconsiderable a force; and their ammunition being nearly consumed, they returned to the ships, leaving the bodies in possession of the natives, together with ten stands of arms.

After the general consternation, which the news of this misfortune had diffused throughout the whole company of both ships, had in some degree subsided, their attention was called to the party at the morai, where the mast and sails were on shore, guarded by only six marines. It is difficult to describe the emotions that agitated the minds of Mr. King and his attendants, at this station, during the time in which these occurrences had happened, at the other side of the bay. Being at the distance only of a mile from the village of Kowrowa, they could distinctly perceive a vast multitude of people collected on the spot where Captain Cook had just before landed. They heard the firing of the musquets, and observed an uncommon bustle and agitation among the crowd. They afterwards saw the islanders retreating, the boats retiring from the shore, and passing and repassing, with great stillness, between the ships. Mr. King's heart soon misgave him on this occasion. Where so valuable a life was concerned, he could not avoid being alarmed by such new and threatening appearances. Besides this, he knew that Captain Cook, from a long series of success, in his transactions with the natives of this ocean, had acquired a degree of confidence, which might, in some ill-fated moment, put him too much off his guard; and Mr. King now saw all the dangers to which that confidence might lead, without deriving much consolation from the consideration of the experience which had given rise to it. His first care, on hearing the report of the musquets, was to assure the islanders, considerable numbers of whom were assembled round the wall of our consecrated field, and seemed at a loss how to account for what they had heard and seen, that they should meet with no molestation; and that, at all events, he was inclined to continue on peaceable terms with them.

In this situation, Mr. King and his attendants remained till the boats had returned on board, when Captain Clerke perceiving, by means of his telescope, that our party was surrounded by the natives, who, he thought, designed to attack them, ordered two four-pounders to be fired at the islanders. These guns, though well aimed, did no mischief; but they gave the natives a convincing proof of their powerful effects. A cocoa-nut tree, under which some of them were sitting, was broken in the middle by one of the balls; and the other shivered a rock, which stood in an exact line with them. As Mr. King had, just before, given them the strongest assurances of their safety, he was extremely mortified at this act of hostility, and, to prevent its being repeated, instantly dispatched a boat to inform Captain Clerke, that he was, at present, on the most amicable terms with the islanders, and that, if any future occasion should arise for changing his conduct towards them, he would hoist a jack, as a signal for Cap-

tain Clerke to afford him his assistance. Mr. King waited the return of the boat with the greatest impatience; and after remaining for the space of a quarter of an hour, under the utmost anxiety and suspense, his fears were at length confirmed, by the arrival of Mr. Bligh, with orders to strike the tents immediately, and to send on board the sails, that were repairing. At the same instant, Kaireekkea having also received information of the death of Captain Cook, from a native who had arrived from the other side of the bay, approached Mr. King, with great dejection and sorrow in his countenance, enquiring whether it was true. At this time the situation of the party was highly critical and important. Not only their own lives, but the issue of the expedition, and the return of at least one of the ships, were involved in the same common danger. They had the mast of the *Resolution*, and the greater part of the sails, on shore, protected by only half a dozen marines. The loss of these would have been irreparable; and though the islanders had not as yet testified the smallest disposition to molest the party, it was difficult to answer for the alteration, which the intelligence of the transaction at Kowrowa might produce. Mr. King therefore thought proper to dissemble his belief of the death of Captain Cook, and to desire Kaireekkea to discourage the report; apprehending that either the fear of our repentment, or the successful example of their countrymen, might perhaps lead them to seize the favourable opportunity, which at this time presented itself, of giving us a second blow. He, at the same time, advised him to bring old Kaoo, and the other priests, into a large house adjoining to the morai, partly from a regard to their safety, in case it should have been found necessary to have recourse to violent measures; and partly from a desire of having him near our people, in order to make use of his authority with the natives, if it could be instrumental in maintaining peace.

Having stationed the marines on the top of the morai, which formed a strong and advantageous post, he intrusted the command to Mr. Bligh, who received the most positive directions to act solely on the defensive; and he then went on board the *Discovery*, in order to confer with Captain Clerke, on the dangerous situation of our affairs. He had no sooner left the spot, than the islanders began to annoy our people with stones; and just after he had reached the ship, he heard the firing of the marines. He therefore hastily returned on shore, where he found affairs growing every moment more alarming. The natives were providing arms, and putting on their mats; and their numbers augmented very fast. He also observed several large bodies advancing towards our party along the cliff, by which the village of Kakooa is separated from the north side of the bay, where Kowrowa is situate. At first they attacked our people with stones from behind the walls of their inclosures, and meeting with no resistance, they soon became more daring. A few courageous fellows, having crept along the beach, under cover of the rocks, suddenly presented themselves at the foot of the morai, with an intention of storming it on the side next the sea, which was its only accessible part; and they were not dislodged before they had stooled a considerable quantity of shot, and had seen one of their number fall. The amazing courage of one of these assailants deserves to be recorded. Having returned with a view of carrying off his companion, amidst the fire of our whole party, he received a wound, which obliged him to quit the body, and retire; but, a few minutes afterwards, he again made his appearance, and receiving another wound, was under the necessity of retreating a second time. At that moment Mr. King arrived at the morai, and saw this man return a third time, faint from the loss of blood and fatigue. Being informed of what had happened, he forbade the soldiers to fire; and the islander was suffered to carry off his friend, which he was just able to accomplish; and then fell down himself, and breathed his last. About this time a strong reinforcement from both ships having landed, the natives retreated behind their walls; which affording Mr. King access to the priests, he sent one of

them to exert his endeavours to bring his countrymen to some terms, and to propose to them, that if they would desist from throwing stones, he would not allow our men to fire. This truce was agreed to, and our people were suffered to launch the mast, and carry off the sails, astronomical instruments, &c. without molestation. As soon as our party had quitted the morai, the islanders took possession of it, and some of them threw a few stones, which, however, did no mischief. Between eleven and twelve o'clock, Mr. King arrived on board the *Discovery*, where he found that no decisive plan had been adopted for the regulation of our future proceedings. The recovery of Captain Cook's body, and the restitution of the boat, were the objects, which, on all hands, we agreed to insist on; and Mr. King declared it as his opinion, that some vigorous methods should be put in execution, if the demand of them should not be instantly complied with. It may justly be supposed that Mr. King's feelings, on the death of a beloved and respected friend, had some share in this opinion; yet there were doubtless other reasons, and those of the most serious nature, that had some weight with him. The confidence which the success of the natives in killing our Commander, and obliging us to leave the shore, must naturally have inspired; and the advantage, however inconsiderable, which they had gained over us the preceding day, would, he had no doubt, excite them to make farther dangerous attempts; and the more particularly, as they had no great reason, from what they had hitherto observed, to dread the effects of our fire-arms. This kind of weapon, indeed, contrary to the expectations of us all, had produced in them no signs of terror. On our side, such was the condition of our vessels, and the state of discipline among us, that, had a vigorous attack been made on us, during the night, the consequences might perhaps have been highly disagreeable. Mr. King was supported, in these apprehensions, by the opinion of the greater part of the officers on board; and nothing seemed to him more likely to encourage the islanders to make the attempt, than the appearance of our being inclined to an accommodation, which they could only impute to weakness or fear. On the other hand it was urged, in favour of more conciliatory measures, that the mischief was already done, and was irreparable; that the natives, by reason of their former friendship and kindness had a strong claim to our regard: and the more particularly, as the late calamitous accident did not appear to have taken its rise from any premeditated design; that, on the part of Terreebooo, his ignorance of the theft, his willingness to accompany Captain Cook on board the *Resolution*, and his having actually sent his two sons into the pinnace, must rescue his character, in this respect, from the smallest degree of suspicion; that the behaviour of his women, and the chiefs, might easily be accounted for, from the apprehensions occasioned in their minds by the armed force, with which Captain Cook landed, and the hostile preparations in the bay; appearances so unsuitable to the confidence and friendship, in which both parties had hitherto lived, that the arming of the islanders was manifestly with a design to resist the attempt, which they had some reason to expect would be made, to carry off their sovereign by force, and was naturally to be expected from a people who had a remarkable affection for their chiefs. To these dictates of humanity, other motives of a prudential kind were added; that we were in want of a supply of water, and other refreshments; that the *Resolution's* foremast would require seven or eight days work, before it could be stepped; that the spring was advancing very fast; and that the speedy prosecution of our next expedition to the northward, ought now to be our sole object; and that, therefore, to engage in a vindictive contest with the natives, might not only subject us to the imputation of needless cruelty, but would require great delay in the equipment of our ships. In this latter opinion Captain Clerke concurred; and though Mr. King was convinced, that an early and vigorous display of our repentment would have more effectually answered every object both of prudence and humanity, he was, upon the

the whole, not sorry that the measures he had recommended were rejected. For though the contemptuous behaviour of the islanders, and their subsequent opposition to our necessary occupations on shore, arising most probably from a misconstruction of our lenity, obliged us at last to have recourse to violence in our own defence; yet he was not certain that the circumstances of the case would, in the opinion of the generality of people, have justified the use of force, on our part, in the first instance. Cautionary severity is ever invidious, and the rigour of a preventive measure, when it is the most successful, leaves its expediency the least apparent.

During these deliberations, and while we were thus engaged in concerting some plan for our future operations, a very numerous concourse of the natives still kept possession of the shore; and some of them coming off in canoes, approached within pistol-shot of the ships, and insulted us by various marks of defiance and contempt. It was extremely difficult to restrain the seamen from the use of their arms on these occasions; but, as pacific measures had been resolved on, the canoes were allowed to return unmolested. Mr. King was now ordered by Captain Clerke to proceed towards the shore with the boats of both ships, well manned and armed, with a view of bringing the islanders to a parley, and of obtaining, if possible, a conference with some of the Erees. If he should succeed in this attempt, he was to demand the dead bodies, and particularly that of Captain Cook: to threaten them, in case of a refusal, with our resentment; but by no means to fire, unless attacked; and not to go ashore on any account whatever. These instructions were delivered to Mr. King before the whole party, in the most positive manner; in consequence of which, he and his detachment left the ships about four o'clock in the afternoon; and as they approached the shore, they perceived every indication of a hostile reception. The natives were all in motion, the women and children retiring; the men arming themselves with long spears and daggers, and putting on their war mats. It also appeared, that since the morning they had thrown up breast-works of stone along the beach, where Captain Cook had landed; in expectation, perhaps, of an attack at that place. When our party were within reach, the islanders began to throw stones at them with slings, but without doing any mischief. Mr. King concluded from these appearances, that all attempts to bring them to a parley would be ineffectual, unless he gave them some ground for mutual confidence: he therefore ordered the armed boats to stop, and advanced alone in the small boat, holding in his hand a white flag; the meaning of which, from an universal shout of joy from the natives, he had the satisfaction to find was immediately understood. The women instantly returned from the side of the hill, whither they had retired; the men threw off their mats, and all seated themselves together by the sea-side, extending their arms, and inviting Mr. King to land.

Notwithstanding such behaviour seemed expressive of a friendly disposition, Mr. King could not avoid entertaining suspicions of its sincerity. But when he saw Koah, with extraordinary boldness and assurance, swimming off towards the boat, with a white flag in his hand, he thought proper to return this mark of confidence, and accordingly received him into the boat, though he was armed; a circumstance which did not contribute to lessen Mr. King's suspicions. He had indeed long harboured an unfavourable opinion of Koah. The priests had always represented him as a person of a malicious temper, and no friend to us; and the repeated detections of his fraud and treachery, had convinced us of the truth of their assertions. Besides the melancholy transactions of the morning, in which he was seen performing a principal part, inspired Mr. King with the utmost horror at finding himself so near him; and as he approached him with feigned tears, and embraced him, Mr. King was so distrustful of his intentions, that he took hold of the point of the pahooa, which the chief held in his hand, and turned it from him. He informed the islander that he had come to demand the

body of Captain Cook, and to declare war against the natives, unless it was restored without delay. Koah assured him that this should be done as soon as possible, and that he would go himself for that purpose; and after requesting a piece of iron of Mr. King, with marks of great assurance, he leaped into the water, and swam ashore, calling out to his countrymen, that we were all friends again. Our people waited with great anxiety near an hour for his return. During this interval, the other boats had approached so near the shore, that the men who were in them entered into conversation with a party of the islanders, at a little distance; by whom they were informed, that the Captain's body had been cut to pieces, and carried up the country; but of this circumstance Mr. King was not apprized till his return to the ships. He therefore now began to express some degree of impatience at Koah's delay; upon which the chiefs pressed him exceedingly to land; assuring him, that if he would go in person to Terrecoboo, the body would be undoubtedly restored to him. When they found they could not prevail on Mr. King to go ashore, they endeavoured, on pretence of conversing with him with greater ease, to decoy his boat among some rocks, where they might have had it in their power to separate him from the other boats. It was easy to see through these artifices, and he was therefore very desirous of breaking off all communication with them; when a chief approached, who had particularly attached himself to Captain Clerke, and the officers of the Discovery, on board which ship he had sailed, when we last quitted the bay, intending to take his passage to the island of Mowee. He said he came from Terrecoboo, to acquaint our people that the body was carried up the country, but that it should be brought back the following morning. There appeared much sincerity in his manner; and being asked, if he uttered a falsehood, he hooked together his two fore fingers, which is here understood as the sign of veracity, in the use of which these islanders are very scrupulous. Being now at a loss how to proceed, Mr. King sent Mr. Vancouver to inform Captain Clerke of all that had passed; that it was his opinion, the natives did not intend to keep their word with us; and, far from being grieved at what had happened, were on the contrary inspired with great confidence on account of their late success, and sought only to gain time, till they could plan some scheme for getting our people into their power. Mr. Vancouver came back with orders for Mr. King to return on board, after giving the islanders to understand, that if the body was not restored the next morning, the town should be destroyed. No sooner did they perceive our party retiring, than they endeavoured to provoke them by the most contemptuous and insulting gestures. Several of our people said, they could distinguish some of the natives parading about in the cloaths which had belonged to our unhappy countrymen, and among them, an Eree brandishing Captain Cook's hanger, and a woman holding the scabbard. In consequence of Mr. King's report to Captain Clerke, of what he supposed to be the present temper and disposition of the inhabitants, the most effectual methods were taken to guard against any attack they might make during the night. The boats were moored with top-chains; additional sentinels were stationed in each of our ships; and guard-boats were directed to row round them, in order to prevent the islanders from cutting the cables. During the night, we saw a vast number of lights on the hills, which induced some of us to imagine, that they were removing their effects farther up into the country, in consequence of our menaces. But it seems more probable, that they were kindled at the sacrifices that were performing on account of the war, in which they supposed themselves likely to be engaged; and, perhaps the bodies of our slain countrymen were at that time burning. We afterwards observed fires of the same kind, as we passed the island of Morotoi; and which, according to the information we received from some of the natives then on board, were made on account of a war they had declared against a neighbouring island. This agrees with what we learned among the Friendly and Society Isles, that,

vious to any hostile expedition, the chiefs always endeavoured to animate the courage of the people, by feasts and rejoicings in the night. We passed the night without any disturbance, except from the howlings and lamentations which were heard on shore.

On Monday the 15th, early in the morning, Koah came along-side the *Resolution*, with a small pig and some cloth, which he desired permission to present to Mr. King. We have already mentioned, that this officer was supposed by the islanders to be the son of Captain Cook; and as the latter had always suffered them to believe it, Mr. King was probably considered as the chief after his death. As soon as he came on deck, he interrogated Koah with regard to the body; and, on his returning evasive answers, refused to accept his presents; and was on the point of dismissing him with expressions of anger and resentment, had not Captain Clerke, with a view of keeping up the appearance of friendship, judged it more proper that he should be treated with the customary respect. This artful priest came frequently to us in the course of the morning, with some trifling present or other; and as we always observed him eyeing every part of the ship with a great degree of attention, we took care he should see we were well prepared for our defence. He was extremely urgent both with Captain Clerke and Mr. King to go on shore, imputing the detention of the bodies to the other chiefs, and assuring those gentlemen, that every thing might be adjusted to their satisfaction, by a personal interview with the king. However, they did not think it prudent to comply with Koah's request; and indeed a fact came afterwards to their knowledge, which proved his want of veracity. For, they were informed, that immediately after the action in which Captain Cook had lost his life, Terrecoboo had retired to a cave in the steep part of the mountain that hangs over the bay, which was accessible only by means of ropes, and where he continued for several days, having his provisions let down to him by cords. After the departure of Koah from the ships, we observed that his countrymen who had assembled by day-break, in vast crowds on the shore, flocked around him with great eagerness on his landing, as if they wished to learn the intelligence he had gained, and what steps were to be taken in consequence of it. It is highly probable, that they expected we should attempt to put our threats in execution; and they appeared fully determined to stand their ground. During the whole morning, we heard conchs blowing in various parts of the coast; large parties were perceived marching over the hills; and, upon the whole, appearances were so alarming, that we carried out a stream anchor, for the purpose of hauling the ship abreast of the town, in case of an attack; and boats were stationed off the northern point of the bay, in order to prevent a surprise from the natives in that quarter. Their warlike posture at present, and the breach of their engagement to restore the bodies of the slain, occasioned fresh debates among us concerning the measures which should now be pursued. It was at length determined, that nothing should be permitted to interfere with the repair of the *Resolution's* mast, and the preparations for our departure; but that we should nevertheless continue our negotiations for the restoration of the bodies of our countrymen. The greater part of this day was employed in getting the fore-mast into a proper situation on deck, that the carpenters might work upon it; and also in making the requisite alterations in the commissions of the officers. The chief command of the expedition having devolved on Captain Clerke, he removed on board the *Resolution*, promoted Lieutenant Gore to the rank of Captain of the *Discovery*, appointed Messrs. King and Williamson first and second Lieutenants of the *Resolution*, and nominated Mr. Harvey, a Midshipman, who had accompanied Captain Cook during his two last voyages, to fill the vacant lieutenantcy. During the whole day, we sustained no interruption from the islanders: and in the evening, the launch was moored with a top-chain, and guard-boats stationed round each of the ships as before. About eight o'clock, it being exceedingly dark, we heard a canoe paddling towards the

ship; and it was no sooner perceived, than both the sentinels on deck fired into it. There were two of the natives in this canoe, who immediately roared out "Tin-nee," (which was their method of pronouncing Mr. King's name), and said they were friends, and had something with them which belonged to Captain Cook. When they came on board, they threw themselves at the feet of our officers, and seemed to be extremely terrified. It fortunately happened that neither of them was hurt, notwithstanding the balls of both pieces had gone through the canoe. One of these was the person who has been already mentioned under the appellation of the taboo man, who constantly attended Captain Cook with the particular ceremonies we have before described; and who, though a man of distinction in the island, could scarcely be prevented from performing for him the most humiliating offices of a menial servant. After bewailing, with many tears, the loss of the *Orono*, he informed us that he had brought a part of his body. He then gave us a small bundle which he brought under his arm; and it is impossible to describe the horror with which we were seized, upon finding in it a piece of human flesh of the weight of about nine or ten pounds. This, he said, was all that now remained of the body; that the rest had been cut in pieces, and burnt; but that the head, and all the bones, except those which belonged to the trunk, were in the possession of Terrecoboo and the other chiefs; that what we saw had been allotted to Kaoo, the chief of the priests, for the purpose of being used in some religious ceremony; and that he had sent it as a testimony of his innocence, and of his attachment to us. We had now an opportunity of learning whether they were cannibals; and we did not neglect to avail ourselves of it. We first endeavoured, by several indirect questions, put to each of them apart, to gain information respecting the manner in which the other bodies had been treated and disposed of; and finding them very constant in one account, that after the flesh had been cut off, the whole of it was burnt; we at last put the direct question, whether they had not fed on some of it; they immediately testified as much horror at such an idea, as any European would have done; and asked, whether that was the practice among us. They afterwards asked us, with great earnestness, and with an appearance of apprehension, when the *Orono* would come again? and how he would treat them on his return? the same enquiry was often made in the sequel by others; and this idea is consistent with the general tenour of their conduct towards him, which indicated that they considered him as a being of a superior species. We pressed our two friendly visitants to continue on board till the next morning, but we could not prevail upon them. They informed us, that if this transaction should come to the knowledge of the king, or any of the other Erees, it might be attended with the most fatal consequences to their whole society; to prevent which, they had been under the necessity of coming to us in the dark; and the same precaution, they said, would be requisite in returning on shore. They further told us, that the chiefs were eager to take revenge on us for the death of their countrymen; and particularly cautioned us against trusting Koah, who, they assured us, was our implacable enemy; and ardently longed for an opportunity of fighting us, to which the blowing of the conchs that we had heard in the morning, was intended as a challenge. It likewise appeared from the information of these men, that seventeen of their countrymen were slain in the first action, at the village of Kowrowa, five of whom were chiefs; and that Kancena and his brother, our particular friends, were of that number. Eight, they said, had lost their lives at the observatory; three of whom likewise were persons of the first distinction. At eleven o'clock the two natives left us, and took the precaution to desire that one of our guard-boats might attend them, till they had passed the *Discovery*, lest they should again be fired upon, which, by alarming their countrymen on shore, might expose them to the danger of detection. This request was readily complied with, and we had the satisfaction to find, that they reached the land safe and undiscovered. During the remainder of this night, we

heard the same loud lamentations, as in the preceding one. Early the following morning, we received a visit from Koah. Mr. King was piqued at finding, that notwithstanding the most glaring marks of treachery in his conduct, and the positive declaration of our friends the priests, he should still be suffered to carry on the same farce, and to make us at least appear the dupes of his hypocrisy. Our situation was indeed become extremely awkward and unpromising; none of the purposes for which this pacific plan of proceedings had been adopted, having hitherto been in any respect promoted by it. No satisfactory answer had been given to our demands; we did not seem to have made any progress towards a reconciliation with the natives; they still remained on the shore in hostile postures, as if determined to oppose any endeavours we might make to go ashore; and yet it was become absolutely necessary to attempt landing, as the completing our stock of water would not admit of any longer delay. However, in justice to the conduct of Captain Clerke, we must remark, that it was highly probable, from the great numbers of the islanders, and from the resolution with which they seemed to expect our approach, that an attack could not have been made without danger; and that the loss of even a very few men might have been severely felt by us, during the remainder of our voyage: whereas the delaying to put our menaces into execution, though, on the one hand, it diminished their opinion of our valour, had the effect of occasioning them to disperse on the other. For this day, about 12 o'clock, upon finding that we persisted in our inactivity, great bodies of them, after blowing their conchs, and using every method of defiance, marched off, over the hills, and never made their appearance afterwards. Those, however, who remained, were not the less daring and presumptuous. One of them had the insolence to come within musquet-shot a-head of the Resolution, and after throwing several stones at us, waved over his head the hat which had belonged to Captain Cook, while his countrymen ashore were exulting and encouraging his audacity. Our people were highly enraged at this insult, and, coming in a body on the quarter-deck, begged they might no longer be obliged to put up with such reiterated provocations, and requested Mr. King to endeavour to obtain permission for them, from Captain Clerke, to take advantage of the first fair occasion of avenging the death of their much lamented Commander. On Mr. King's acquainting the Captain with what was passing, he ordered some great guns to be fired at the islanders on shore; and promised the crew, that, if they should be molested at the watering-place, the next day, they should then be permitted to chastise them. Before we could bring our guns to bear, the natives had suspected our intentions, from the bustle and agitation they observed in the ship; and had retired behind their houses and walls. We were consequently obliged to fire, in some degree, at random; notwithstanding which, our shot produced all the effects we could desire: for, in a short time afterwards, we perceived Koah paddling towards us, with the greatest haste; and when he arrived, we learned that some people had lost their lives, and among the rest Maiha-maiha, a principal Eree, nearly related to Terreeoboo. Not long after Koah's arrival, two boys swam off from the Morai towards our vessels, each armed with a long spear; and after they had approached pretty near, they began in a very solemn manner to chant a song; the subject of which, from their frequently mentioning the word Orono, and pointing to the village where Captain Cook had been slain, we concluded to be the late calamitous occurrence. Having sung for near a quarter of an hour in a plaintive strain, during all which time they continued in the water, they repaired on board the Discovery, and delivered up their spears; and after remaining there a short time, returned on shore. We could never learn who sent them, or what was the object of this ceremony. During the night, we took the usual precautions for the security of the ships; and, as soon as it was dark, the two natives, who had visited us the preceding evening, came off to us again. They assured us, that though the effects of

our great guns this afternoon, had greatly alarmed the chiefs, they had by no means relinquished their hostile intentions, and they advised us to be on our guard.

On Wednesday, the 17th, the boats of both ships were dispatched ashore to procure water; and the Discovery was warped close to the beach, in order to protect the persons employed in that service. We soon found that the intelligence which had been sent us by the priests, was not destitute of foundation, and that the islanders were determined to neglect no opportunity of annoying us, when it could be done without much hazard. The villages, throughout this whole cluster of islands, are, for the most part, situated near the sea; and the adjacent ground is enclosed with stone walls, of the height of about three feet. These, we at first supposed, were designed for the division of property; but we now discovered that they served for a defence against invasion, for which purpose they were, perhaps, chiefly intended. They consist of loose stones, and the natives are very dexterous in shifting them, with great quickness, to such particular situations, as the direction of the attack may occasionally require. In the sides of the mountain that stands near the bay, they have likewise holes, or caves, of considerable depth, whose entrance is secured by a fence of a similar kind. From behind both these stations, the islanders perpetually harassed our watering party with stones; nor could the inconsiderable force we had on shore, with the advantage of musquets, compel them to retreat. Thus opposed, our people were so occupied in attending to their own safety, that, during the whole forenoon, they filled only one ton of water. It being therefore impossible for them to perform this service, till their assailants were driven to a greater distance, the Discovery was ordered to dislodge the enemy with her great guns; which being accomplished by means of a few discharges, the men landed without molestation. The natives, however, made their appearance again soon afterwards, in their usual method of attack; and it was now deemed absolutely necessary to burn down some straggling huts, near the wall behind which they had sheltered themselves. In executing the orders that were given for that purpose, our people were hurried into acts of unnecessary devastation and cruelty. Some allowance ought certainly to be made for their resentment of the repeated insults, and contemptuous behaviour of the islanders, and for their natural desire of revenging the death of their beloved and respected Commander. But, at the same time, their conduct strongly evinced, that the greatest precaution is requisite in trusting, even for a moment, the discretionary use of arms in the hands of private soldiers, or seamen, on such occasions. The strictness of discipline, and the habits of obedience, by which their force is kept directed to suitable objects, lead them to conceive, that whenever they have the power, they have likewise a right to perform. Actual disobedience being almost the only crime for which they expect to receive punishment, they are apt to consider it as the sole measure of right and wrong; and hence they are too ready to conclude, that what they can do with impunity, they may also do consistently with honour and justice; so that the feelings of humanity, and that generosity towards an unresisting enemy, which, at other times, is a striking distinction of brave men, become but feeble restraints to the exercise of violence, when set in opposition to the desire they naturally have of shewing their own power and independence.

We have before observed, that directions had been given to burn only a few straggling houses, which afforded shelter to the islanders. We were therefore greatly surprized on perceiving the whole village in flames; and before a boat, that was sent to stop the progress of the mischief, could reach the land, the habitations of our old and constant friends, the priests, were all on fire. Mr. King had, therefore, great reason to lament the illness that confined him on board this day. The priests had always been under his protection; and, unfortunately, the officers then on duty having seldom been on shore at the Morai, were but little acquainted with the circumstances of the place. Had he

been

been present himself, he might, in all probability, have been the means of preserving their little society from destruction. In escaping from the flames, several of the inhabitants were shot; and our people cut off the heads of two of them, and brought them on board. The fate of one unhappy native was much lamented by all of us. As he was repairing to the well for water, he was shot at by one of the marines. The ball happened to strike his calibashi, which he instantly threw from him, and ran off. He was pursued into one of the caves above-mentioned, and no lion could have defended his den with greater bravery and fierceness; till at length, after he had found means to keep two of our people at bay for a considerable time, he expired, covered with wounds. This accident first brought us acquainted with the use to which these caverns are applied. About this time a man, advanced in years, was taken prisoner, bound, and conveyed on board the Resolution, in the same boat, with the heads of his two countrymen. We never observed horror so strongly portrayed, as in the face of this person, nor so violent a transition to immoderate joy, as when he was untied, and given to understand, that he might depart in safety. He shewed us that he was not deficient in gratitude, as he not only often returned afterwards with presents of provisions, but also did us other services.

Soon after the destruction of the village, we saw, coming down the hill, a man, accompanied by fifteen or twenty boys, who held in their hands pieces of white cloth, plantains, green boughs, &c. It happened that this pacific embassy, as soon as they were within reach, received the fire of a party of our men. This, however, did not deter them from continuing their procession, and the officer on duty came up, in time, to prevent a second discharge. As they made a nearer approach, the principal person proved to be our friend Kaireckee, who had fled when our people first set fire to the village, and had now returned, and expressed his desire of being sent on board the Resolution. On his arrival we found him extremely thoughtful and grave. We endeavoured to convince him of the necessity there was of setting fire to the village, by which his house, and those of his brethren were unintentionally destroyed. He expostulated with us on our ingratitude and want of friendship; and, indeed, it was not till the present moment, that we knew the whole extent of the injury that had been done them. He informed us, that, confiding in the promises Mr. King had made them, and as well as in the assurances they had received from the men, who had brought us some of Captain Cook's remains, they had not removed their effects back into the country, as the other inhabitants had done, but had put every valuable article of their own, as well as what they had collected from us, into a house adjoining to the morai, where they had the mortification to see it all set on fire by our people. He had, on coming on board, perceived the heads of his two countrymen lying on deck, at which he was greatly shocked, and earnestly desired that they might be thrown over-board. This request, by the directions of Captain Clerke, was immediately complied with. In the evening our watering party returned on board, having sustained no farther interruption. We passed a disagreeable night; the cries and lamentations we heard from the shore being far more dreadful than ever. Our only consolation on this occasion, arose from the hopes that a repetition of such severities might not be requisite in future. It is somewhat remarkable, that, amidst all these disturbances, the female natives, who were on board, did not offer to leave us, or discover any apprehensions either for themselves or their friends on shore. They appeared, indeed, so perfectly unconcerned, that some of them, who were on deck when the village was in flames, seemed to admire the spectacle, and frequently exclaimed, that it was maitai, or very fine.

On Thursday, the 18th, in the morning, the treacherous Koah came off to the ships, as usual. There being no longer any necessity for keeping terms with him, Mr. King was allowed to treat him as he thought proper. When he approached the side of the Resolution, sing-

ing a song, and offering a hog, and some plantains, to Mr. King, the latter ordered him to keep off, and cautioned him never to make his appearance again without the bones of Captain Cook, lest his life should pay the forfeit of his repeated breach of faith. He did not appear much mortified with this unwelcome reception, but immediately returned on shore, and joined a party of his countrymen, who were throwing stones at our waterers. The body of the young man, who had been killed the preceding day, was found this morning lying at the entrance of the cave; and a mat was thrown over him by some of our people; soon after which they saw several of the natives carrying him off on their shoulders, and could hear them chanting, as they marched, a mournful song. At length the islanders being convinced that it was not their want of ability to chastize them, which had induced us at first to tolerate their provocations, desisted from molesting our people; and, towards the evening, a chief, named Eappo, who had seldom visited us, but whom we knew to be a man of the first distinction, came with presents from Terreeboob to sue for peace. These presents were accepted, and the chief was dismissed with the following answer: That no peace would be granted, till the remains of Captain Cook should be restored. From Eappo we understood that the flesh of all the bones of our people who had been slain, as well as the bones of the trunks, had been burnt; that the limb-bones of the marines had been distributed among the inferior chiefs; and that the remains of Captain Cook had been disposed of as follows: the head to a great Eree, called Kahoopoeou; the hair to Maiha-maiha; and the arms, legs, and thighs, to Terreeboob. After it was dark, many of the natives came off with various sorts of vegetables; and we also received from Kaireckee two large presents of the same articles.

On the 19th we were principally employed in sending and receiving the messages that passed between Captain Clerke and the old king. Eappo was very urgent, that one of our officers should go on shore; and offered to remain on board, in the mean time, as an hostage. This request, however, was not complied with; and he left us with a promise of bringing the bones the following day. Our watering party, at the beach, did not meet with the least opposition from the islanders; who notwithstanding our cautious behaviour, again ventured themselves among us without any marks of diffidence or apprehension. On Saturday the 20th, early in the morning, we had the satisfaction of getting the fore-mast stepped. This operation was attended with considerable difficulty, and some danger, our ropes being so extremely rotten, that the purchase several times gave way. Between the hours of ten and eleven, we saw a numerous body of the natives descending the hill, which is over the beach, in a sort of procession, each man carrying on his shoulders two or three sugar-canes, and some bread-fruit, plantains, and taro, in his hand. They were preceded by two drummers, who, when they reached the water-side, seated themselves by a white flag, and began beating their drums, while those who had followed them, advanced, one by one, and deposited the presents they had brought with them; after which they retired in the same order. Soon afterwards Eappo appeared in his long feathered cloak, bearing something with great solemnity in his hands; and having stationed himself on a rock, he made signs that a boat should be sent him. Captain Clerke, supposing that the chief had brought the bones of our late Commodore (which, indeed, proved to be the case), went himself in the pinnace to receive them, and ordered Mr. King to attend him in the cutter. When they arrived at the beach, Eappo, entering the pinnace, delivered the bones to Captain Clerke, wrapped up in a great quantity of fine new cloth, and covered with a spotted cloak of black and white feathers. He afterwards attended our gentlemen to the Resolution, but could not be prevailed on to accompany them on board; being, perhaps, from a sense of decency, unwilling to be present at the opening of the parcel. In this we found both the hands of Captain Cook entire, which were

were well known to us from a scar on one of them, that divided the fore-finger from the thumb, the whole length of the metacarpal bone; the skull, but with the scalp separated from it, and the bones of the face wanting; the scalp, with the ears adhering to it, and the hair upon it cut short; the bones of both the arms, with the skin of the fore-arms hanging to them; the bones of the thighs and legs joined together, but without the feet. The ligaments of the joints were observed to be entire; and the whole shewed sufficient marks of having been in the fire, except the hands, which had the flesh remaining upon them, and were cut in several places, and crammed with salt, most probably with a view of preserving them. The skull was free from any fracture, but the scalp had a cut in the back part of it. The lower jaw and feet, which were wanting, had been seized, as Eappo informed us, by different Erees; and he also told us, that Terreeoboo was using every means to recover them.

The next morning, being the 21st of February, Eappo, and the king's son, came on board, and brought with them not only the remaining bones of Captain Cook, but likewise the barrels of his gun, his shoes,

and some other trifles which had belonged to him. Eappo assured us, that Terreeoboo, Maiha-maiha, and himself were extremely desirous of peace; that they had given us the most convincing proofs of it; and that they had been prevented from giving it sooner by the other chiefs, many of whom were still disaffected to us. He lamented, with the most lively sorrow, the death of six chiefs, who had been killed by our people; some of whom, he said, were among our best friends. He informed us, that the cutter had been taken away by Pareea's people, probably in revenge for the blow that he had received; and that it had been broken up the following day. The arms of the marines, which we had also demanded, had been carried off, he said, by the populace and were irrecoverable.

Nothing now remained, but to perform the last solemn offices to our excellent Commander. Eappo was dismissed with orders to taboo all the bay; and, in the afternoon, his remains having been deposited in a coffin, the funeral service was read over them, and they were committed to the deep with the usual military honours. Our feelings, on this mournful occasion, are more easy to be conceived than expressed.

C H A P. XVI.

The Taboo laid on the bay taken off, and the ships surrounded with canoes—Orders for the Resolution and Discovery to be unmoored—They weigh anchor and take their departure from Karakakooa bay—Sail in quest of a harbour on the south-east side of Mowee—Driven to leeward by the current, and strong easterly winds—Pass Tohoorowa—South-west side of Mowee described—Proceed to Woaboo—Its north coast described—Disappointed in attempting to water—Sail to Atooi; and anchor in Wymoa bay—The natives not so friendly as before—Their insolence in demanding a hatchet for every cask of water—Treat our people with contempt—Steal Lieutenant King's hanger—Their insolence at the water side—Are fired at by two marines—One of them wounded—A visit from the contending Chiefs—The ships anchor off Onecheew—Their departure—A correct, copious, and complete account of Sandwich Islands—Extent of Owhyhee, the largest of the whole group—Its districts, coasts, adjacent country, &c. described—An account of several other islands—A particular and full account of the inhabitants of Sandwich Islands—Division of the people into three classes—Genealogical account of the kings of Owhyhee and Mowee—Authority of the Erees—Tyranny of Pareea exercised on an inferior chief—An account of their religion—Their society of priests—Their ideas of a future state—A particular description of the word Taboo—A remarkable instance of jealousy—Funeral ceremonies at the death of an old Chief, &c. &c. &c.

ON the 22nd of February, 1779, during the morning, not a canoe came near the bay, the taboo, which Eappo, at our request, had laid on it the preceding day, having not yet been taken off. At length that chief came on board; when we assured him that we were now perfectly satisfied; and that, as the Orono was buried, all remembrance of the late unhappy transactions was buried with him. We afterwards requested him to take off the taboo, and to make it known, that the islanders might bring provisions to us as usual. The ships were soon surrounded with canoes, and many of the Erees came on board, expressing their grief at what had happened, and their satisfaction at our reconciliation. Several of our friends, who did not favour us with a visit, sent presents of large hogs, and other provisions. Among the rest, the old treacherous Koah came off to us, but we refused him admittance. We were now preparing to put to sea, and Captain Clerke imagining, that, if the intelligence of our proceedings should reach the islands to leeward before us, it might have a bad effect, gave orders, that the ships should be unmoored. About eight in the evening, we dismissed all the natives; and Eappo, and the friendly Kaireekca, took their leave of us in a very affectionate manner. We immediately weighed anchor, and stood out of Karakakooa bay. The islanders were assembled in great numbers on the shore; and, as we passed along, received our last farewells, with every mark of good-will and affection. About ten o'clock P. M. having cleared the land, we stood to the northward, with a view of searching for an harbour, which the natives had often mentioned, on the south-east side of Mowee. We found ourselves, the next morning, driven to leeward, by a swell from the N. E. and a fresh gale, from the same quarter, drove us still farther to the westward. At midnight we tacked and stood four hours to the S. to

keep clear of the land; and, at day-break, on the 24th, we were standing towards a small barren island, named Tahoorowa, about seven miles S. W. of Mowee. Having now no prospect of making a closer examination of the S. E. parts of Mowee, we bore away, and kept along the S. E. side of Tahoorowa: Steering close round its western extremity, in order to fetch the W. side of Mowee, we suddenly shoaled our water, and saw the sea breaking on some rocks almost right a-head. We then kept away about a league and a half, and again steered to the northward; when we stood for a passage between Mowee, and an island named Ranai. In the afternoon, the weather was calm, with light airs from the W. We stood to the N. N. W. but observing a shoal about sunset, and the weather being unsettled, we stood towards the S. We had passed the S. W. side of this island, without being able to approach the shore. It forms the same distant view as the N. E. as seen when we returned from the N. in November, 1778; the hilly parts, connected by a low flat isthmus, having, at the first view, the appearance of two separate islands. This deceptive appearance continued, till we were within about ten leagues of the coast, which bending a great way inward, formed a capacious bay. The westernmost point, off which the shoal runs that we have just now mentioned, is rendered remarkable by a small hillock; S. of which is a fine sandy bay; and, on the shore, are several huts, with plenty of cocoa-trees about them. In the course of the day, several of the natives visited us, and brought provisions with them. We presently discovered, that they had heard of our unfortunate disasters at Owhyhee. They were extremely anxious to be informed of the particulars, from a woman who had hid herself in the Resolution, in order to obtain a passage to Atooi; making particular enquiries about Pareea, and some other chiefs; and seeming much agitated

agitated at the death of Kancenā, and his brother. But, in whatever light this business might have been represented by the woman, it produced no bad effect in their behaviour, which was civil and obliging to an extreme.

On Thursday, the 25th, in the morning, the wind being at E. we steered along the S. side of Ranai, till almost noon, when we had baffling winds and calms till the evening; after which, we had a light easterly breeze, and steered for the W. of Morotoi. The current, which had set from the N. E. ever since we left Karakakooa bay, changed its direction, in the course of this day, to the S. E. The wind was again variable during the night; but, early in the morning of the 26th, it settled at E. blowing so fresh, as to oblige us to double-reef the top-sails. At seven, we opened a small bay, distant about two leagues, having a fine sandy beach; but not perceiving any appearance of fresh water, we endeavoured to get to the windward of Woahoo, an island which we had seen in January, 1778. We saw the land about two in the afternoon, bearing W. by N. at the distance of about eight leagues. We tacked, as soon as it was dark, and again bore away at day-light on the 27th. Between ten and eleven, we were about a league off the shore, and near the middle of the N. E. side of the island.

The coast to the northward, consists of detached hills, ascending perpendicularly from the sea; the sides being covered with wood, and the vallies, between them, appearing to be fertile, and well cultivated. An extensive bay was observable to the southward, bounded, to the S. E. by a low point of land, covered with cocoanut trees; off which, an insulated rock appeared, at the distance of a mile from the shore. The wind continuing to blow fresh, we were unwilling to entangle ourselves with a lee-shore. Instead of attempting, therefore, to examine the bay, we hauled up, and steered in the direction of the coast. At noon, we were about two leagues from the island, and a-breast of the N. point of it. It is low and flat, having a reef stretching off almost a mile and an half. Between the N. point, and a head-land to the S. W. the land bends inward, and seemed to promise a good road. We therefore steered along the shore, at about a mile distance. At two, we were induced, by the sight of a fine river, to anchor in thirteen fathoms water. In the afternoon, Mr. King attended the two Captains on shore, where few of the natives were to be seen, and those principally women. The men, we were informed, were gone to Morotoi, to fight Tahyterree; but their chief, Perrecorance, remained behind, and would certainly attend us, as soon as he was informed of our arrival. To our great disappointment, the water had a brackish taste, for about two hundred yards up the river; beyond which, however, it was perfectly fresh, and was a delightful stream. Farther up, we came to the conflux of two small rivulets, branching off to the right and left of a steep romantic mountain. The banks of the river, and all that we saw of Woahoo, are in fine cultivation, and full of villages; the face of the country being also remarkably beautiful and picturesque. It would have been a laborious business to have watered at this place, Mr. King was therefore dispatched to search about the coast to leeward; but, being unable to land, on account of a reef of coral, which extended along the shore, Captain Clerk resolved to proceed immediately to Atooi. In the morning, about eight, we weighed and stood to the north; and, on Sunday, the 28th, at day-light, we bore away for that island, and were in sight of it by noon. We were off its eastern extremity, which is a green flat point, about sun-set. As it was dark, we did not venture to run for the road on the S. W. side, but spent the night in plying on and off, and anchored, at nine the next morning, being Monday the 1st of March, in 25 fathoms water. In running down, from the S. E. point of the island, we saw, in many places, the appearance of shoal water, at some distance from the land. Being anchored in our old station, several canoes came to visit us; but it was very observable, that there was not that appearance of cor-

diality in their manner, and complacency in their countenances, as when we saw them before. They had no sooner got on board, but one of them informed us, that we had communicated a disorder to the women, which had killed many persons of both sexes. He, at that time, was afflicted with the venereal disease, and minutely described the various symptoms which had attended it. As no appearance of that disorder had been observed amongst them, on our first arrival, we were, it is to be feared, the authors of this irreparable mischief. What we had principally in view, at this place, was to water the ships with as much expedition as possible; and Mr. King was sent on shore in the afternoon, with the launch and pinnace, laden with casks. He was accompanied by the gunner of the Resolution, who was instructed to trade for some provisions; and they were attended by a guard of five marines. Multitudes of people were collected upon the beach, by whom, at first, we were kindly received; but, after we had landed the casks, they began to be exceedingly troublesome. Knowing from experience, how difficult a task it was to repress this disposition, without the interposition of their chiefs, we were sorry to be informed, that they were all at a distant part of the island. Indeed, we both felt and lamented the want of their assistance; for we could hardly form a circle, as our practice usually was, for the safety and convenience of the trading party. No sooner had we taken this step, and posted marines to keep off the populace, than a man took hold of the bayonet belonging to one of the soldier's muskets, and endeavoured to wrench it forcibly from his hand. Mr. King immediately advanced towards them, when the native quitted his hold, and retired; but immediately returned, having a spear in one hand, and a dagger in the other; and it was with difficulty that his countrymen could restrain him from engaging with the soldier. This affray was occasioned by the native's having received, from the soldier, a slight prick with his bayonet, to induce him to keep without the line. At this time, our situation required great management and circumspection; Mr. King accordingly enjoined, that no one should presume to fire, or proceed to any other act of violence, without positive commands. Having given these instructions, he was summoned to the assistance of the watering party, where he found the natives in the same mischievous disposition. They had peremptorily demanded, for every cask of water, a large hatchet; which not being complied with, they would not permit the sailors to roll them to the boats. When Mr. King had joined them, one of the natives approached him, with great insolence, and made the same demand. Mr. King told him, that as a friend, he was welcome to a hatchet, but he certainly would carry off the water, without paying for it; and instantly ordered the pinnace men to proceed; at the same time calling for three marines, from the trading party, to protect them. This becoming spirit so far succeeded, as to prevent any daring attempt to interrupt us; but they still persevered in the most teasing and insulting behaviour. Some of them, under pretence of assisting the sailors, in rolling the casks towards the shore, gave them a different direction; others stole the hats from off our people's heads, pulled them backward by the skirts of their clothes, and tripped up their heels; the populace, during all this time, shouting and laughing, with a mixture of mockery and malice. They afterwards took an opportunity of stealing the cooper's bucket, and forcibly took away his bag. Their principal aim, however, was to possess themselves of the muskets of the marines, who were continually complaining of their attempts to force them from their hands. Though they, in general, preserved a kind of deference and respect for Mr. King, yet they obliged him to contribute his share towards their stock of plunder. One of them approached him, in a familiar manner, and diverted his attention, whilst another seized his hanger, which he held carelessly in his hand, and ran away with it. Such insolence was not to be repelled by force. Prudence dictated that we must patiently submit to it; at the same time, guarding against its effects as well as we were able.

able. Mr. King was, however, somewhat alarmed, on being soon after informed by the serjeant of marines, that, turning suddenly round, he saw a man behind him, armed with a dagger, in the position of striking. Though he might, perhaps, be mistaken, in this particular, our situation was truly critical and alarming; and the smallest error or mistake, on our part, might have been of fatal consequences.

Our people being separated into three small parties; one filling casks at the lake; another rolling them to the shore; and a third purchasing provisions; Mr. King had some intentions of collecting them together, in order to protect the performance of one duty at a time. But, on due reflection, he thought it more advisable to let them proceed as they had begun. If a real attack had been made, even our whole force could have made but a poor resistance. He thought, on the other hand, that such a step might operate to our disadvantage, as being an evident token of our fears. Besides, in the present case, the crowd was kept divided, and many of them wholly occupied in bartering. Perhaps the principal cause of their not attacking us was, their dread of the effects of our arms; and, as we appeared to place so much confidence in this advantage, as to oppose only five marines to such a multitude of people, their ideas of our superiority must have been greatly exalted. It was our business to cherish this opinion; and, it must ever be acknowledged, to the honour of the whole party, that it was impossible for any men to behave better, in order to strengthen these impressions. Whatever could be considered as a jest, they received with patience and good-nature; but, if they were interrupted by any serious attempt, they opposed it with resolute looks and menaces. At length, we so far succeeded, as to get all our casks to the sea-side, without any accident of consequence: but, while our people were getting the casks into the launch, the inhabitants, thinking they should have no farther opportunity of plundering, grew more daring and insolent. The serjeant of marines luckily suggested to Mr. King, the advantage of fending off his party first into the boats, by which means the musquets would be taken out of their reach; which, as above related, were the grand objects the islanders had in view: and, if they should happen to attack us, the marines could more effectually defend us, than if they were on shore. Every thing was now in the boats, and only Mr. King, Mr. Anderson, the gunner, and a seaman of the boat's crew, remained on shore. The pinnace laying beyond the surf, which we were under a necessity of swimming through, Mr. King ordered the other two to make the best of their way to it, and told them he would follow them. They both refused to comply with this order, and it became a matter of contest, who should be the last on shore. Some hasty expression, it seems, Mr. King had just before made use of to the sailor, which he considered as a reflection on his courage, and excited his resentment; and the old gunner, as a point of honour was now started, conceived it to be his duty to take a part in it. In this whimsical situation, they, perhaps, might have long remained, had not the dispute been settled by the stones, which began to fly plentifully about us, and by the exclamations of the people from the boats, begging us to be expeditious, as the natives were armed with clubs and spears, and pursuing us into the water. Mr. King arrived first at the pinnace, and, perceiving Mr. Anderson was so far behind, as not to be entirely out of danger, he ordered one musquet to be fired; but, in the hurry of executing his orders, the marines fired two. The natives immediately ran away, leaving only one man and woman on the beach. The man attempted to rise several times, but was not able, having been wounded in the groin. The islanders, in a short time, returned; and, surrounding the wounded man, brandished their spears at us, with an air of defiance; but, by the time we reached the ships, some persons arrived which we supposed to be the chiefs, by whom they were all driven from the shore. During our absence Captain Clerke had been under terrible apprehensions for our safety; which had been considerably increased by his misunder-

standing some of the natives, with whom he had conversed on board. The name of Captain Cook being frequently mentioned, accompanied with circumstantial descriptions of his death and destruction, he concluded, that they had received intelligence of the unfortunate events at Owhyhee, to which they alluded. But they were only endeavouring to make him understand, what wars had arisen on account of the goats, which Captain Cook had left at Oneeheow, and that the poor goats had been slaughtered, during the contest for the property of them. Captain Clerke, applying these shocking representations to our misfortunes at Owhyhee, and to an indication of revenge, fixed his telescope upon us the whole time; and, as soon as he saw the smoke of the musquets, ordered the boats to be put off to our assistance.

On Tuesday, the 2d of March, in the morning, Mr. King was again ordered on shore, with the watering party. As we had so narrowly escaped the preceding day, Captain Clerke augmented our force from both ships, and we had a guard of forty men under arms. This precaution, however, was found to be unnecessary; for the beach was left entirely to ourselves, and the ground, extending from the landing-place to the lake, tabooed. Hence we concluded, that some of the chiefs had visited this quarter; who, being unable to stay, had considerably taken this step, that we might be accommodated with safety. Several men appeared with spears and daggers, on the other side of the river, but never attempted to molest us. Their women came over, and seated themselves close by us, on the banks; and about the middle of the day, some of the men were prevailed on to bring us hogs and roots, and also to dress them for us. When we had left the beach, they came down to the sea-side, and one of them had the audacity to throw a stone at us; but, as his conduct was highly censured by the rest, we did not express any kind of resentment. On the 3d, we completed our watering, without much difficulty; and, on returning to the ships, we were informed, that several chiefs had been on board, and had apologized for the conduct of their countrymen, attributing their riotous behaviour to the quarrels then subsisting among the principal people of the island, and which had destroyed all order and subordination. At this time the government of Atooi was disputed between Toneoneo, who had the supreme power when we were there the preceding year, and a youth named Teavee. By different fathers, they are both the grandsons of Perecorannee, king of Woahoo; who gave Atooi to the former, and Oneeheow to the latter. The quarrel originated about the goats which we had left at Oneeheow the year before; they being claimed by Toneoneo, as that island was a dependency of his. The adherents of Teavee insisting on the right of possession, both parties prepared to support their pretensions, and a battle ensued just before our arrival, wherein Toneoneo had been defeated. Toneoneo was likely to become more affected by the consequence of this victory, than by the loss of the objects in dispute; for the mother of Teavee having married a second husband, who was not only a chief at Atooi, but also at the head of a powerful faction there, he thought of embracing the present opportunity of driving Toneoneo out of the island, that his son-in-law might succeed to the government. The goats, which had increased to six, and would probably have stocked these islands in a few years, were destroyed in this contest. Thursday, the 4th, we were visited, on board the Resolution, by the father-in-law, the mother, and the sister of the young prince, who made several curious presents to Captain Clerke. Among the rest, were some fish-hooks, which were made from the bones of Terrecoboo's father, who had been killed in an unsuccessful descent upon Woahoo. Also a fly-flap, from the hands of the prince's sister, which had a human bone for its handle, and had been given to her by her father-in-law, as a trophy. They were not accompanied by young Teavee, he being then engaged in the performance of some religious rites, on account of the victory he had obtained. The 5th and 6th, were employed in completing the Discovery's water.

The carpenters were engaged in caulking the ships, and preparing for our next cruise. We no longer received any molestation from the natives, who supplied us plentifully with pork and vegetables.

This day we were visited by an Indian, who brought a piece of iron on board, to be formed into the shape of a pahooa. It was the bolt of some large ship timbers, but neither the officers nor men could discover to what nation it belonged; though from the shape of the bolt, and the paleness of the iron, they were convinced it was not English. They enquired strictly of the native how he came possessed of it, when he informed them, that it was taken out of a large piece of timber, which had been driven upon their island, since we were there in January, 1778.

On Sunday, the 7th, we received a visit from Toneoneo, at which we were surprized. Hearing the dowager prince was on board, he could hardly be prevailed on to enter the ship. When they met, they cast an angry lowering look at each other. He did not stay long, and appeared much dejected. We remarked, however, with some degree of surprize, that the women prostrated themselves before him, both at his coming and going away; and all the natives on board treated him with that respect which is usually paid to persons of his rank. It was somewhat remarkable, that a man, who who was then in a state of actual hostility with Teavee's party, should venture alone within the power of his enemies. Indeed, the civil dissensions, which are frequent in all the south sea islands, seem to be conducted without much acrimony; the deposed governor still enjoying the rank of an Eree, and may put in practice such means as may arise, to regain the consequence which he has lost.

On the 8th, at nine in the morning, we weighed, and proceeded towards Onecheow, and came to anchor in 20 fathoms water, at about three in the afternoon, nearly on the spot where we anchored in 1778. With the other anchor, we moored in 26 fathoms water. We had a strong gale from the eastward in the night, and, the next morning, the ship had driven a whole cable's length, both anchors being almost brought a-head; in which situation we were obliged to continue, this and the two following days.

On Friday, the 12th, the weather being more moderate, the Master was dispatched to the N. W. side of the island, in search of a more commodious place for anchoring. In the evening he returned, having found a fine bay, with good anchorage, in 18 fathoms water. The points of the bay were in the direction of N. by E. and S. by W. A small village was situated on the N. side of the bay, to the eastward of which were four wells of good water. Mr. Bligh went far enough to the N. to convince himself that Orechoua, and Onecheow, were two separate islands. Being now on the point of taking our final leave of the Sandwich Islands, it may be proper to give here a general and correct account of their situation, and natural history, as well as of the customs and manners of the natives; which will serve as a kind of supplement to a former description, the result of our first visit to these islands.

This group is composed of 11 islands, extending in long. from 199 deg. 36 min. to 205 deg. 6 min. E. and in lat. from 18 deg. 54 min. to 22 deg. 15 min. N. Their names, according to the natives, are, 1. Owhyhee, 2. Atooi, Atowi, or Towi; which is also sometimes called Kowi. 3. Weahoo, or Oahoo. 4. Mowee. 5. Morotoi, or Morokoi. 6. Orechoua, or Reehoua. 7. Morotinne, or Morokinne. 8. Tahooraa, 9. Ranai, or Oranai. 10. Onecheow, or Nehecow. 11. Kahowrowee, or Tahoorowa. These are all inhabited, except Tahooraa and Morotinne. Besides those we have enumerated, we heard of another island named Modoo-papapa, or Komodoo-papapa, situated to the W. S. W. of Tahooraa; it is low and sandy, and is visited solely for the purpose of catching turtle and water-fowl. As we could never learn that the natives had knowledge of any other islands, it is most probable that no others exist in their neighbourhood. Captain Cook had distinguished this cluster of islands by the name of the Sandwich

Islands, in honour of the Earl of Sandwich, then first Lord of the Admiralty, under whose administration he had enriched Geography with so many valuable discoveries; a tribute justly due to that nobleman, for the encouragement and support which these voyages derived from his power, and for the zealous eagerness with which he seconded the views of our illustrious navigator.

The most easterly of these islands, called Owhyhee, and by far the largest of them all, is of a triangular figure, and nearly equilateral. The angular points constitute the northern, southern, and eastern extremities. The lat. of the northern extreme is 20 deg. 17 min. N. and its long. 204 deg. 2 min. E. the southern end stands in the long. of 204 deg. 15 min. E. and in the lat. of 18 deg. 54 min. N. and the eastern extremity is in the lat. of 19 deg. 34 min. N. and in the long. of 205 deg. 6 min. E. The circumference of the whole island is about 255 geographical miles, or 293 English ones. Its breadth is 24 leagues; and its greatest length, which lies nearly in a N. and S. direction, is 28 leagues and a half. It is divided into six extensive districts, namely, Akona and Koarra, which are on the W. side; Kaoo and Opoona, on the S. E. and Aheedoo and Amakooa, on the N. E. A mountain, named Mouna Kaah, (or the mountain Kaah) which rises in three peaks, continually covered with snow, and may be discerned at the distance of 40 leagues, separates the district of Amakooa from that of Aheedoo. The coast, to the northward of this mountain, is composed of high and abrupt cliffs, down which fall many beautiful cascades of water. We once flattered ourselves with the hopes of finding a harbour round a bluff head, on a part of this coast, in the lat. of 20 deg. 10 min. N. and the long. of 204 deg. 26 min. E. but after we had doubled the point, and were standing close in, we found that it was connected, by a low valley, with another elevated head to the north-westward. The country rises inland with a gradual ascent, and is intersected by narrow deep glens, or rather chasms: it seemed to be well cultivated, and to have many villages scattered about it. The snowy mountain above-mentioned is very steep, and its lowest part abounds with wood. The coast of Aheedoo is of a moderate elevation; and the interior parts have the appearance of being more even than the country towards the N. W. We cruised off these two districts for near a month; and whenever our distance from the shore would permit, were surrounded by canoes laden with refreshments of every kind. On this side of the island, we often met with a very heavy sea, and a great swell; and, as there was much foul ground off the shore, we seldom made a nearer approach to the land than two or three leagues. Towards the N. E. of Apoona, the coast, which constitutes the eastern extreme of the island, is rather low and flat. In the inland parts the acclivity is very gradual; and the country abounds with bread-fruit, and cocoa-nut trees. This appeared to us to be the finest part of the whole island; and we were afterwards informed, that the king occasionally resided here. The hills, at the south-western extremity, rise with some abruptness from the sea-side, leaving only a narrow border of low land towards the beach. The sides of these hills were covered with verdure; but the adjacent country seemed thinly inhabited. When our ships doubled the E. point of the island, we had sight of another snowy mountain, called by the natives, Mouna Roa (or the extensive mountain) which, during the whole time we were sailing along the south-eastern side, continued to be a very conspicuous object. It was flat at the summit, which was perpetually involved in snow; and we once observed its sides also slightly covered with it for a considerable way down. According to the tropical line of snow, as determined by Monsieur Condamine, from observations made on the Cordilleras in America, the height of this mountain must be, at least, 16,020 feet. It therefore exceeds the height of the Pico de Teyde, or Peak of Teneriffe, by 3680 feet, according to the computation of the Chevalier de Borda, or 724, according to that of Dr. Heberden. The peaks of Mouna Kaah seemed to be of the height of about half a mile; and,

as they are wholly covered with snow, the altitude of their summits must at least be 18,400 feet.

The district of Kaoo exhibits a most horrid and dismal prospect; the whole country having, to appearance, undergone an entire change from the consequences of some dreadful convulsion. The ground is, in all parts, covered with cinders; and, in many places, intersected with blackish streaks, which seem to mark the progress of a lava that has flowed, not many centuries ago, from Mouna Roa to the shore. The south promontory appears like the mere dregs of a volcano. The head-land consists of broken and craggy rocks, terminating in acute points, and irregularly piled on each other. Notwithstanding the dreary aspect of this part of the island, it contains many villages, and is far more populous than the verdant mountains of Apoona. Nor is it difficult to account for this circumstance. These islanders not being possessed of any cattle, have no occasion for pasturage; and are therefore inclined to prefer such ground as is either more conveniently situated for fishing, or best adapted to the cultivation of plantains and yams. Now amidst these ruins, there are many spots of rich soil, which are with great care laid out in plantations; and the neighbouring sea abounds with excellent fish of various kinds. Off this part of the coast, at less than a cable's length from the shore, we did not strike ground with 160 fathoms of line, except in a small bight to the E. of the southern point, where we found from 50 to 58 fathoms of water, over a sandy bottom. It may be proper to observe, before we proceed to give an account of the western districts, that the whole coast we have described, from the northern to the southern extreme, affords not a single harbour, nor the least shelter for shipping. The south-western parts of Akona are in a condition similar to that of the adjoining district of Kaoo; but the country further towards the N. has been carefully cultivated, and is exceedingly populous. In this division of the island lies Karakakooa bay, of which we have already given a description. Scarce any thing is seen along the coast, but the fragments of black scorched rocks; behind which the ground, for the space of about two miles and a half, rises gradually, and seems to have been once covered with loose burnt stones. These have been cleared away by the inhabitants, frequently to the depth of three feet and upwards; and the fertility of the soil has amply repaid their labour. Here they cultivate in a rich ashy mould, the cloth-plant and sweet potatoes. Groves of cocoa-nut-trees are scattered among the fields, which are enclosed with stone fences. On the rising ground beyond these, they plant bread-fruit trees, which flourish with surprising luxuriance. The district of Koaarra extends from the most westerly point to the northern extreme of the island. The whole coast between them forms a spacious bay, which is called by the natives Toeyah-yah, and is bounded to the northward by two conspicuous hills. Towards the bottom of this bay, there is foul, corally ground, that extends to the distance of upwards of a mile from the shore, without which there is good anchorage. The country, as far as the eye could discern, appeared to be fruitful and populous; but no fresh water was to be found. The soil seemed to be of the same kind with that of the district of Kaoo.

Having thus described the coasts of the island of Owhyhee, and the adjacent country, we shall now relate some particulars respecting the interior parts, from the information we obtained from a party, who set out on the 26th of January, on an expedition up the country, principally with an intention of reaching the snowy mountains. Having previously procured two of the islanders to serve them as guides, they quitted the village about four o'clock in the afternoon. Their course was easterly, inclining a little to the south. Within three or four miles from the bay, they found the country as already described; but the hills afterwards rose with a less gradual ascent, which brought them to some extensive plantations, consisting of the taro or eddy root, and sweet potatoes, with plants of the cloth-tree. Both the taro and the sweet potatoes are here planted at the distance of four feet from each other. The potatoes are earthed up almost to the top of the stalks, with a pro-

per quantity of light mould. The taro is left bare to the root, and the mould round it is put in the form of a basin, for the purpose of holding the rain-water; this root requiring a certain degree of moisture. At the Friendly and Society Isles, the taro was constantly planted in low and moist situations, and generally in those places where there was the convenience of a rivulet to flood it. This mode of culture was considered as absolutely necessary; but we now found that this root, with the precaution before-mentioned, succeeds equally well in a more dry situation. It was, indeed, remarked by all of us, that the taro of the Sandwich Islands was the best we had ever tasted. The walls, by which these plantations are separated from each other, are composed of the loose burnt stones, which are met with in clearing the ground; and, being totally concealed by sugar-canes, that are planted close on each side, form the most beautiful fences that can be imagined. Our party stopped for the night at the second hut they observed among the plantations, where they supposed themselves to be six or seven miles distant from our ships. The prospect from this spot was described by them as very delightful: they had a view of our vessels in the bay before them; to the left they saw a continued range of villages, interspersed with groves of cocoa-nut-trees, spreading along the shore; a thick wood extending itself behind them; and, to the right, a very considerable extent of ground, laid out with great regularity in well-cultivated plantations, displayed itself to their view. Near this spot the natives pointed out to them, at a distance from every other dwelling, the residence of a hermit, who, they said, had, in the former part of his life, been a great chief and warrior, but had long ago retired from the sea-coast of the island, and now never quitted the environs of his cottage. As they approached him, they prostrated themselves, and afterwards presented him with some provisions. His behaviour was easy, frank, and cheerful. He testified little astonishment at the sight of our people, and though pressed to accept of some European curiosities, he thought proper to decline the offer, and soon retired to his cottage. Our party represented him as by far the most aged person they had ever seen; judging him to be, at a moderate computation, upwards of a hundred years of age. As they had supposed that the mountain was not more than ten or a dozen miles distant from the bay, and consequently expected to reach it with ease early the following morning, they were now greatly surprized to find the distance scarce perceptibly diminished. This circumstance, with the uninhabited state of the country which they were on the point of entering, rendering it necessary to provide a supply of provisions, they dispatched one of their conductors back to the village for that purpose. Whilst they waited his return, they were joined by several of Kaoo's servants, whom that generous old man had sent after them, loaded with refreshments, and fully authorized, as their rout lay through his grounds, to demand, and take away with them whatever they might want. Our travellers were surprized on finding the cold here so intense. But, as they had no thermometer with them, they could only form their judgment of it from their feelings; which, from the warm atmosphere they had quitted, must have been a very fallacious method of judging. They found it, however, so cold, that they could scarce get any sleep, and the islanders could not sleep at all; both parties being disturbed, during the whole night, by continual coughing. As they, at this time, could not be at any very great height, their distance from the sea being no more than six or seven miles, and part of the road on a very moderate ascent, this uncommon degree of cold must be attributed to the easterly wind blowing fresh over the snowy mountains. Early the next morning, they proceeded on their journey, and filled their calabashes at a well of excellent water, situate about half a mile from their hut. After they had passed the plantations, they arrived at a thick wood, which they entered by a path that had been made for the convenience of the islanders, who frequently repair thither for the purpose of catching birds, as well as procuring the wild or horse-plantain. Their progress now became extremely

tremely slow, and was attended with great labour; for the ground was either swampy, or covered with large stones; the path narrow, and often interrupted by trees lying across it, which they were obliged to climb over, as the thickness of the underwood, on each side, rendered it impracticable to pass round them. They saw, in these woods, pieces of white cloth fixed on poles, at small distances, which they imagined were land marks for the division of property, as they only observed them where the wild plantains grew. The trees were of the same kind with the spice tree of New Holland; they were straight and lofty, and their circumference was from two to four feet. Having advanced nine or ten miles in the wood, they had the mortification of finding themselves, suddenly, within sight of the sea, and not very far from it; the path having turned off imperceptibly to the S. and carried them to the right of the mountain, which it was their intention to reach. Their disappointment was considerably heightened by the uncertainty under which they now were with respect to its true bearings, as they could not at present gain a view of it from the top of the highest trees. They, therefore, thought proper to walk back six or seven miles to an unoccupied hut, where they had left two of their own people, and three of the natives, with the small remnant of their provisions. Here they passed the second night, during which the air was so extremely sharp, that, by the morning, their guides were all gone off, except one.

Being at this time in want of provisions, which laid them under a necessity of returning to some of the cultivated parts of the island, they left the wood by the same path by which they had entered it. When they arrived at the plantations, they were surrounded by the islanders, from whom they purchased a fresh supply of necessaries; and prevailed upon two of them to accompany them as guides, in the room of those who had gone away. Having procured the best information they could possibly obtain with regard to the direction of their road, the party, who were now nine in number, marched for about half a dozen miles along the skirts of the wood, and then entered it again by a path leading towards the E. They passed, for the first three miles, through a forest of lofty spice-trees, which grew on a rich loam. At the back of these trees they met with an equal extent of low shrubby trees, together with a considerable quantity of thick under-wood, upon a bottom of loose burnt stones. This led them to another forest of spice-trees, and the same rich brownish soil, which was again succeeded by a barren ridge of a similar kind with the former. These ridges, as far as they could be seen, appeared to run parallel with the sea shore, and to have Mouna Roa for their centre. In passing through the woods they found many unfinished canoes, and huts in several places; but they saw none of the inhabitants. After they had penetrated almost three miles into the second wood, they arrived at two huts, where they stopped, being greatly fatigued with the day's journey, in the course of which they had walked, according to their own computation, at least twenty miles. Having found no springs from the time they quitted the plantations, they had greatly suffered from the violence of their thirst; in consequence of which they were obliged, before the evening came on, to separate into small parties, and go in quest of water. They, at last, met with some that had been left by rain in the bottom of a half-finished canoe; which, though of a reddish colour, was no means unwelcome to them. Throughout the night, the cold was more intense than before; and though they had taken care to wrap themselves up in mats and clothes of the country, and to keep a large fire between the two huts, they could get but very little sleep, and were under the necessity of walking about for the greatest part of the night. Their elevation was now, in all probability, pretty considerable, as the ground, over which their journey lay, had been generally on the ascent. On the next morning, which was the 29th, they set out early, with an intention of making their last and greatest effort to reach the snowy mountain; but their spirits were considerably de-

pressed, on finding that the miserable pittance of water, which they had discovered the preceding night, was expended. The path, which reached no farther than where canoes had been built, being now terminated, they were obliged to make their way as well as they could; frequently climbing up into the most lofty trees, to explore the surrounding country. They arrived, about eleven o'clock, at a ridge of burnt stones, from the top of which they had a prospect of the Mouna Roa, which then appeared to be at the distance of between twelve and fourteen miles from them. They now entered into a consultation, whether they should proceed any further, or rest contented with the view before them of the snowy mountain. Since the path had ceased, their road had become highly fatiguing, and was growing still more so, every step they advanced. The ground was almost every where broken into deep fissures, which, being slightly covered with moss, made them stumble almost continually; and the intervening space consisted of a surface of loose burnt stones, which broke under their feet. Into some of these fissures they threw stones, which seemed from the noise they made, to fall to a considerable depth; and the ground sounded hollow as they walked upon it. Besides these circumstances, which discouraged them from proceeding, they found their conductors so averse to going on, that they had reason to think they would not be prevailed on to remain out another night. They, therefore, at length came to a determination of returning to the ships, after taking a survey of the country from the highest trees they could find. From this elevation, they perceived themselves surrounded with wood towards the sea; they were unable to distinguish, in the horizon, the sky from the water; and between them and the snowy mountain, was a valley of about eight miles in breadth. They passed this night at a hut in the second forest; and the following day, before noon, they had passed the first wood, and found themselves nine or ten miles to the N. E. of the ships, towards which they marched through the plantations. As they walked along, they did not observe a spot of ground, that was susceptible of improvement, left unplanted; and, indeed, the country, from their account, could scarcely be cultivated to greater advantage for the purposes of the natives. They were surprised at seeing several fields of hay; and, upon their enquiry, to what particular use it was applied, they were informed, that it was intended to cover the grounds where the young taro grew, in order to preserve them from being scorched by the rays of the sun. They observed, among the plantations, a few huts scattered about, which afforded occasional shelter to the labourers: but they did not see any villages at a greater distance from the sea than four or five miles. Near one of them, which was situated about four miles from the bay, they discovered a cave, forty fathoms in length, three in breadth, and of the same height. It was open at each end; its sides were fluted, as if wrought with a chissel; and the surface was glazed over, perhaps by the action of fire. Having thus related the principal circumstances that occurred in the expedition to the snowy mountain at Owhyhee, we shall now proceed to describe the other islands of this groupe.

That which is next in size, and nearest in situation to Owhyhee, is Mowee. It stands at the distance of eight leagues N. N. W. from Owhyhee, and is 140 geographical miles in circuit. It is divided by a low isthmus into two circular peninsulas, of which that to the eastward is named Whamadooa, and is twice as large as that to the W. called Owhyrookoo. The mountains in both rise to a very great height, as we were able to see them at the distance of about 30 leagues. The northern shores, like those of the isle of Owhyhee, afford no soundings; and the country bears the same aspect of fertility and verdure. The E. point of Mowee is in the latitude of 20 deg. 50 min. N. and in the longitude of 204 deg. 4 min. E. To the southward, between Mowee and the adjacent islands, we found regular depths with 150 fathoms, over a bottom

of sand. From the western point, which is rather low, runs a shoal, extending towards the island of Ranai, to a considerable distance; and to the S. of this, is an extensive bay, with a sandy beach, shaded with cocoa-trees. It is not improbable, that good anchorage might be met with here, with shelter from the prevailing winds; and that the beach affords a commodious landing-place. The country further back is very romantic in its appearance. The hills rise almost perpendicularly, exhibiting a variety of peaked forms; and their steep sides, as well as the deep chasms between them, are covered with trees, among which those of the bread-fruit principally abound. The summits of these hills are perfectly bare, and of a reddish brown hue. The natives informed us, that there was a harbour to the S. of the eastern point, which they asserted was superior to that of Karakakooa; and we also heard that there was another harbour, named Keepookeepoo, on the north-western side.

Ranai is about nine miles distant from Mowee and Morotoi, and is situate to the S. W. of the passage between those two isles. The country, towards the S. is elevated and craggy; but the other parts of the island had a better appearance, and seemed to be well inhabited. It abounds in roots, such as sweet potatoes, taro, and yams; but produces very few plantains, and bread-fruit trees. The S. point of Ranai is in the latitude of 20 deg. 46 min. N. and in the longitude of 203 deg. 8 min. E.

Morotoi lies at the distance of two leagues and a half to the W. N. W. of Mowee. Its south-western coast, which was the only part of it we approached, is very low; but the land behind rises to a considerable elevation; and, at the distance from which we had a view of it, appeared to be destitute of wood. Yams are its principal produce; and it may probably contain fresh water. The coast, on the southern and western sides of the island, forms several bays, that promise a tolerable shelter from the trade winds. The W. point of Morotoi is in the longitude of 202 deg. 46 min. E. and in the latitude of 21 deg. 10 min. N.

Tahoorowa is a small island situated off the south-western part of Mowee, from which it is nine miles distant. It is destitute of wood, and its soil seems to be sandy and unfertile. Its latitude is 20 deg. 38 min. N. and its longitude 203 deg. 27 min. E. Between it and Mowee stands the little island of Morrotinne, which has no inhabitants.

Woahoo lies about seven leagues to the N. W. of Morotoi. As far as we were enabled to judge, from the appearance of the north-western and north-eastern parts (for we had not an opportunity of seeing the southern side) it is by far the finest of all the Sandwich Islands. The verdure of the hills, the variety of wood and lawn, and fertile well cultivated valleys, which the whole face of the country presented to view, could not be exceeded. Having already described the bay in which we anchored, formed by the northern and western extremes, it remains for us to observe, that, in the bight of the bay, to the southward of our anchoring-place, we met with foul rocky ground, about two miles from the shore. If the ground tackling of a ship should happen to be weak, and the wind blow with violence from the N. to which quarter the road is entirely open, this circumstance might be attended with some degree of danger: but, provided the cables were good, there would be no great hazard, as the ground from the anchoring-place, which is opposite the valley through which the river runs, to the northern point, consists of a fine sand. The latitude of our anchoring-place is 21 deg. 43 min. N. and the longitude 202 deg. 9 min. E.

The district of Atooi is about 25 leagues to the N. W. of Woahoo. Towards the N. E. and N. W. the face of the country is ragged and broken; but, to the southward, it is more even; the hills rise from the sea-side with a gentle acclivity, and, at a little distance back, are covered with wood. Its produce is the same with that of the other islands of this cluster; but its inhabitants greatly excel the people of all the neighbouring islands in the management of their plantations.

No. 73.

In the low grounds, contiguous to the bay wherein we anchored, these plantations were regularly divided by deep ditches; the fences were formed with a neatness approaching to elegance, and the roads through them were finished in such a manner, as would have reflected credit even on an European engineer. The longitude of Wymoa Bay, in this island, is 200 deg. 20 min. E. and its latitude 21 deg. 57 min. N.

Ooneheow is five or six leagues to the westward of Atooi. Its eastern coast is high, and rises with abruptness from the sea; but the other parts of the island consist of low ground, except a round bluff head on the south-eastern point. It produces plenty of yams, and of the sweet root called tee. The anchoring-place at this island lies in the latitude of 21 deg. 50 min. N. and in the longitude of 199 deg. 45 min. E.

Oreehoua and Tahooru are two little islands, situate in the neighbourhood of Ooneheow. The former is an elevated hummock, connected with the northern extreme of Ooneheow, by a reef of coral rocks. Its latitude is 22 deg. 2 min. N. and its longitude 199 deg. 52 min. E. The latter stands to the S. E. and is uninhabited: its longitude is 199 deg. 36 min. E. and its latitude 21 deg. 43 min. N.

The climate of the Sandwich Isles is, perhaps, rather more temperate than that of the West India islands, which are in the same latitude; but the difference is very inconsiderable. The thermometer, on shore near Karakakooa Bay, never rose to a greater height than 88 deg. and that but one day: its mean height, at twelve o'clock, was 83 deg. Its mean height at noon, in Wymoa Bay, was 76 deg. and, when out at sea, 75 deg. In the island of Jamaica, the mean height of the thermometer, at twelve o'clock, is about 86 deg. at sea, 80 deg. Whether these islands are subject to the same violent winds and hurricanes with the West Indies, we could not ascertain, as we were not here during any of the tempestuous months. However, as no vestiges of their effects were any where to be seen, and as the islanders gave us no positive testimony of the fact, it is probable, that, in this particular, they resemble the Friendly and Society Isles, which are, in a great degree, free from such tremendous visitations. There was a greater quantity of rain, particularly in the interior parts, during the four winter months that we continued among these islanders, than commonly falls in the West Indies in the dry season. We generally observed clouds collecting round the summits of the hills, and producing rain to leeward; but after the wind has separated them from the land, they disperse, and are lost, and others supply their place. This occurred daily at Owhyhee; the mountainous parts being usually enveloped in a cloud; showers successively falling in the inland country; with a clear sky, and fine weather, in the neighbourhood of the shore. The winds were, for the most part, from E. S. E. to N. E. In the harbour of Karakakooa we had every day and night a sea and land breeze. The currents sometimes set to windward, and at other times to leeward, without the least regularity. They did not seem to be directed by the winds, nor by any other cause that we can assign: they often set to windward against a fresh breeze. The tides are exceedingly regular, ebbing and flowing six hours each. The flood-tide comes from the E. and, at the full and change of the moon, it is high-water at three quarters of an hour after three o'clock. Their greatest rise is two feet seven inches.

The quadrupeds of these islands, are confined to three sorts, namely, hogs, dogs, and rats. The dogs are of the same species with those we saw at Otaheite, having pricked ears, long backs, and short crooked legs. We did not observe any variety in them, except in their skins; some being perfectly smooth, and others having long rough hair. They are about as large as a common turnspit, and seem to be extremely sluggish in their nature; though this may, probably, be more owing to the manner in which they are treated, than to their natural disposition. They are generally fed with the hogs, and left to herd with those animals; and we do not recollect a single instance of a dog being made a companion here,

as is the custom in Europe. Indeed, the practice of eating them seems to be an insuperable bar to their being admitted into society; and as there are no beasts of prey, nor objects of chase, in these islands, the social qualities of the dog, its attachment, fidelity, and sagacity, will, in all probability, remain unknown to the natives. In our observations it did not appear that the dogs in the Sandwich Islands were near so numerous, in proportion, as at Otaheite. But, on the other hand, they have a much greater plenty of hogs, and the breed is of a larger kind. We procured from them an amazing supply of provisions of this sort. We were upwards of three months, either cruising off the coast, or in harbour at Owhyhee; during all which time the crews of both ships had constantly a large allowance of fresh pork, inasmuch that our consumption of that article was computed at about 60 puncheons of 500 weight each. Besides this quantity, and the extraordinary waste, which, amidst such abundance, could not be entirely prevented, 60 more puncheons were salted for sea store. The greater part of this supply was drawn from the isle of Owhyhee alone; and yet we did not perceive that it was at all exhausted, or even that the plenty had decreased. The birds of these islands are numerous, though the variety is not great. Some of them may vie with those of any country in point of beauty. There are four species that seem to belong to the trochili, or honey-suckers of Linnaeus. One of them is somewhat larger than a bullfinch; its colour is a glossy black, and the thighs and rump-vent are of a deep yellow. The natives call it hoohoo. Another is of a very bright scarlet; its wings are black, with a white edge, and its tail is black. It is named eeevee by the inhabitants. The third is variegated with brown, yellow, and red, and seems to be either a young bird, or a variety of the preceding. The fourth is entirely green, with a yellow tinge, and is called akaiearooa. There is also a small bird of the fly-catcher kind; a species of thrush, with a greyish breast; and a rail, with very short wings, and no tail. Ravens are met with here, but they are extremely scarce; they are of a dark brown colour, inclining to black, and their note is different from that of the European raven. We found two small birds, that were very common, and both of which were of one genus. One of these was red, and was usually observed about the cocoa-trees, from whence it seemed to derive a considerable part of its subsistence. The other was of a green colour. Both had long tongues, which were ciliated, or fringed at the tip. A bird with a yellow head was likewise very common here: from the structure of its beak, our people called it a parroquet: it, however, does not belong to that tribe, but bears a great resemblance to the *lexia flavicans*, or yellowish cross-bill of Linnaeus. Here are also owls, curlews, petrels, and gannets; plovers of two species, one nearly the same as our whistling plover; a large white pigeon; the common water-hen; and a long-tailed bird, which is of a black colour, and the vent and feathers under the wings yellow.

The vegetable produce of the Sandwich Isles is not very different from that of the other islands of the Pacific Ocean. We have already observed, that the taro root, as here cultivated, was superior to any we had before tasted. The bread-fruit trees thrive here, not indeed in such abundance as at Otaheite, but they produce twice as much fruit as they do on the rich plains of that island. The trees are nearly of the same height; but the branches shoot out from the trunk considerably lower, and with greater luxuriance of vegetation. The sugar-canes of these islands grow to an extraordinary size. One of them was brought to us at Atooi, whose circumference was eleven inches and a quarter; and it had fourteen feet eatable. At Onecheow we saw some large brown roots, from six to ten pounds in weight, resembling a yam in shape. The juice, of which they yield a great quantity, is very sweet, and is an excellent succedaneum for sugar. The natives are exceedingly fond of it, and make use of it as an article of their common diet; and our people likewise found it very palatable and wholesome. Not being able to procure

the leaves of this vegetable, we could not ascertain to what species of plant it belonged; but we supposed it to be the root of some kind of fern.

The natives of the Sandwich Isles are doubtless of the same extraction with the inhabitants of the Friendly and Society Islands, of New Zealand, the Marquesas, and Easter Island; a race which possesses all the known lands between the longitudes of 167 deg. and 260 deg. E. and between the latitudes of 47 deg. S. and 22 deg. N. This fact, extraordinary as it is, is not only evinced by the general resemblance of their persons, and the great similarity of their manners and customs, but seems to be established, beyond all controversy, by the identity of their language. It may not, perhaps, be very difficult to conjecture, from what continent they originally emigrated, and by what steps they have diffused themselves over so immense a space. They bear strong marks of affinity to some of the Indian tribes, which inhabit the Ladrões and Caroline Isles; and the same affinity and resemblance, may also be traced among the Malays and the Battas. At what particular time these migrations happened is less easy to ascertain; the period, in all probability, was not very late, as they are very populous, and have no tradition respecting their own origin, but what is wholly fabulous; though, on the other hand, the simplicity which is still prevalent in their manners and habits of life, and the unadulterated state of their general language, seem to demonstrate, that it could not have been at any very remote period. The natives of the Sandwich Islands, in general, exceed the middle size, and are well made. They walk in a very graceful manner, run with considerable agility, and are capable of enduring a great degree of fatigue: but, upon the whole, the men are inferior with respect to activity and strength, to the inhabitants of the Friendly Islands, and the women are less delicate in the formation of their limbs than the Otaheitean females. Their complexion is somewhat darker than that of the Otaheiteans; and they are not altogether so handsome in their persons as the natives of the Society Isles. Many of both sexes, however, had fine open countenances; and the women, in particular, had white well-set teeth, good eyes, and an engaging sweetness and sensibility of look. The hair of these people is of a brownish black, neither uniformly curling, like that of the African Negroes, nor uniformly straight, as among the Indians of America; but varying, in this respect, like the hair of Europeans. There is one striking peculiarity in the features of every part of this great nation; which is, that, even in the most handsome faces, there is always observable, a fulness of the nostril, without any flatness or spreading of the nose, that distinguishes them from the inhabitants of Europe. It is not wholly improbable, that this may be the effect of their customary method of salutation, which is performed by pressing together the extremities of their noses. The same superiority that we generally observed at other islands in the persons of the Erees, is likewise found here. Those that were seen by us were perfectly well formed; whereas the lower class of people, besides their general inferiority, are subject to all the variety of figure and make, that is met with in the populace of other parts of the world. But we met with more frequent instances of deformity here, than in any of the other islands we visited. While we were cruising off Owhyhee, two dwarfs came on board; one of whom was an old man, of the height of four feet two inches, but very well proportioned; and the other was a woman, nearly of the same stature. We afterwards saw, among the natives, three who were hump-backed, and a young man who had been destitute of hands and feet, from the very moment of his birth. Squinting is also common among them; and a man, who, they told us, had been born blind, was brought to us for the purpose of being cured. Besides these particular defects, they are, in general, extremely subject to boils and ulcers, which some of us ascribed to the great quantity of salt they usually eat with their fish and flesh. Though the Erees are free from these complaints, many of them experience still more dreadful effects from the too frequent use of the ava. Those who

who were the most affected by it, had their eyes red and inflamed, their limbs emaciated, their bodies covered with a whitish scurf, and their whole frame trembling and paralytic, attended with a disability of raising their heads.

Though it does not appear that this drug universally shortens life, (for Terrecoboo, Kaoo, and several other chiefs, were far advanced in years) yet it invariably brings on a premature and decrepid old age. It is a fortunate circumstance for the people, that the use of it is made a peculiar privilege of the chiefs. The young son of Terrecoboo, who did not exceed 12 or 13 years of age, frequently boasted of his being admitted to drink ava; and shewed us, with marks of exultation, a small spot in his side that was beginning to grow scaly. When Captain Cook first visited the Society Isles, this pernicious drug was very little known among them. In his second voyage, he found it greatly in vogue at Ulitea; but it had still gained little ground at Otaheite. During the last time we were there, the havoc it had made was almost incredible, inasmuch that Captain Cook scarce recognized many of his former acquaintances. It is also constantly drunk by the chiefs of the Friendly Isles, but so much diluted with water, that it scarcely produces any bad consequences. At Atooi, likewise, it is used with great moderation; and the chiefs of that island are, on this account, a much finer set of men, than those of the neighbouring islands. It was remarked by us, that, upon discontinuing the use of this root, its noxious effects quickly wore off. We prevailed upon our friends Kaoo and Kaireekaea, to abstain from it; and they recovered surprisingly during the short time we afterwards remained among them.

It may be thought, that to form any probable conjectures with regard to the population of islands, with many parts of which we have but an imperfect acquaintance, to be a task highly difficult. There are two circumstances, however, which remove much of this objection. One is, that the interior parts of the country are almost entirely uninhabited: if, therefore, the number of those who inhabit the parts adjoining to the coast, be ascertained, the whole will be determined with some degree of accuracy. The other circumstance is, that there are no towns of any considerable extent, the houses of the islanders being pretty equally scattered in small villages round all their coasts. On these grounds we shall venture at a rough calculation of the number of persons in this cluster of islands.

Karakakooa bay, in Owhyhee, is about three miles in extent, and comprehends four villages of about 80 houses each, upon an average, in all 320; besides many straggling habitations, which may make the whole amount to 350. If we allow six people to each house, the country about the bay will then contain 2,100 persons. To these we may add 50 families, or 300 souls, which we imagine to be nearly the number employed among the plantations in the interior parts of the island; making, in all, 2,400. If this number be applied to the whole coast round the island, a quarter being deducted for the uninhabited parts, it will be found to contain 150,000 persons. The other Sandwich Islands, by the same method of calculation, will appear to contain the following number of inhabitants: Mowee, 65,400; Atooi, 54,000; Morotoi, 36,000; Woahoo, 60,200; Ranai, 25,400; Oneheou, 10,000; and Oreehoua, 4,000. These numbers, including the 150,000 in Owhyhee, will amount to 400,000. In this computation we have by no means exceeded the truth in the total amount.

We must confess, notwithstanding the great loss we sustained from the sudden resentment and violence of these islanders, that they are of a very mild and affectionate disposition, equally remote from the distant gravity and reserve of the natives of the Friendly Isles, and the extreme volatility of the Otaheiteans. They seem to live in the greatest friendship and harmony with each other. Those women who had children, shewed a remarkable affection for them, and paid them a particular and constant attention; and the men, with a willingness that did honour to their feelings, frequently afforded their assistance

in those domestic employments. We must, however, remark, that they are greatly inferior to the inhabitants of the other islands, in that best criterion of civilized manners, the respect paid to the female sex. Here the women are not only deprived of the privilege of eating with the men, but are forbidden to feed on the best sorts of provisions. Turtle, pork, several kinds of fish, and some species of plantains, are denied them; and we were informed, that a girl received a violent beating, for having eaten, while she was on board one of our ships, a prohibited article of food. With regard to their domestic life, they seem to live almost wholly by themselves, and meet with little attention from the men, though no instances of personal ill-treatment were observed by us. We have already had occasion to mention the great kindness and hospitality, with which they treated us. Whenever we went ashore, there was a continual struggle who should be most forward in offering little presents for our acceptance, bringing provisions and refreshments, or testifying some other mark of respect. The aged persons constantly received us with tears of joy, appeared to be highly gratified with being permitted to touch us, and were frequently drawing comparisons between us and themselves, with marks of extreme humility. The young women, likewise, were exceedingly kind and engaging, and attached themselves to us, without reserve, till they perceived, notwithstanding all our endeavours to prevent it, that they had cause to repent of our acquaintance. It must, however, be observed, that these females were, in all probability, of the inferior class; for we saw very few women of rank during our continuance here. These people, in point of natural capacity, are, by no means, below the common standard of the human race. The excellence of their manufactures, and their improvements in agriculture, are doubtless adequate to their situation and natural advantages. The eagerness of curiosity, with which they used to attend the armourer's forge, and the various expedients which they had invented, even before our departure from these islands, for working the iron obtained from us, into such forms as were best calculated for their purposes, were strong indications of docility and ingenuity. Our unhappy friend, Kaneena, was endowed with a remarkable quickness of conception, and a great degree of judicious curiosity. He was extremely inquisitive with respect to our manners and customs. He enquired after our sovereign; the form of our government; the mode of constructing our ships; the productions of our country; our numbers; our method of building houses; whether we waged any wars; with whom, on what occasions, and in what particular manner they were carried on; who was our deity; besides many other questions of a similar import, which seemed to indicate a comprehensive understanding. We observed two instances of persons disordered in their senses; the one a woman at Oneheou, the other a man at Owhyhee. From the extraordinary respect and attention paid to them, it appeared, that the opinion of their being divinely inspired, which prevails among most of the oriental nations, is also countenanced here.

We are inclined to think, that the practice of feeding on the bodies of enemies, was originally prevalent in all the islands of the Pacific Ocean, though it is not known, by positive and decisive evidence, to exist in any of them, except New-Zealand. The offering up human victims, which is manifestly a relique of this barbarous custom, still universally obtains among these islanders; and it is not difficult to conceive why the inhabitants of New-Zealand should retain the repast, which was, perhaps, the concluding part of these horrid rites, for a longer period than the rest of their tribe, who were situated in more fertile regions. As the Sandwich islanders, both in their persons and disposition, bear a nearer resemblance to the New-Zealanders, than to any other people of this very extensive race, Mr. Anderson was strongly inclined to suspect, that, like them, they are still cannibals. The evidence, which induced him to entertain this opinion, has been already laid down; but, as Mr. King had great doubts of the

the justness of his conclusions, we shall mention the grounds on which he ventured to differ from him. With regard to the intelligence received on this head from the natives themselves, it may not be improper to observe, that most of the officers on board took great pains to enquire into so curious a circumstance; and that, except in the instances above referred to, the islanders invariably denied that any such practice existed among them. Though Mr. Anderson's superior knowledge of the language of those people, ought certainly to give considerable weight to his judgment, yet, when he examined the man who had the little parcel, containing a piece of salted flesh, Mr. King, who was present on that occasion, was strongly of opinion, that the signs made use of by the islander intimated nothing more, than that it was designed to be eaten, and that it was very agreeable or wholesome to the stomach. In this sentiment Mr. King was confirmed, by a circumstance of which he was informed, after the decease of his ingenious friend Mr. Anderson, namely, that most of the inhabitants of these islands carried about with them a small piece of raw pork, well salted, either put in a calabash, or wrapped up in some cloth, and fastened round the waist: this they esteemed a great delicacy, and would frequently taste it. With regard to the confusion the lad was in, (for his age did not exceed 16 or 18 years) no person could have been surprized at it, who had been witness of the earnest and eager manner in which Mr. Anderson interrogated him. Mr. King found it less easy to controvert the argument deduced from the use of the instrument made with shark's teeth, which is of a similar form with that used by the New-Zealanders for cutting up the bodies of their enemies. Though he believed it to be an undoubted fact, that they never make use of this instrument in cutting the flesh of other animals, yet as the practice of sacrificing human victims, and of burning the bodies of the slain, still prevails here, he considered it as not altogether improbable, that the use of this knife (if it may be so denominated) is retained in those ceremonies. He was, upon the whole, inclined to imagine, and particularly from the last-mentioned circumstance, that the horrible custom of devouring human flesh has but lately ceased in these and other islands of the Pacific Ocean. Omiah acknowledged, that his countrymen, instigated by the fury of revenge, would sometimes tear with their teeth the flesh of their slain enemies; but he peremptorily denied that they ever eat it. The denial is a strong indication that the practice has ceased; for in New-Zealand, where it is still prevalent, the natives never scrupled to confess it.

The natives of the Sandwich Islands, almost universally permit their beards to grow. There were, however, a few who cut off their beard entirely, among whom was the aged king; and others wore it only on their upper-lip. The same variety that is found among the other islanders of this ocean, with respect to the mode of wearing the hair, is likewise observable here. They have, besides, a fashion which seems to be peculiar to themselves: they cut it close on each side of their heads, down to their ears, and leave a ridge, of the breadth of a small hand, extending from the forehead to the neck; which, when the hair is pretty thick and curling, resembles, in point of form, the crest of the helmet of an ancient warrior. Some of them wear great quantities of false hair, flowing in long ringlets down their backs; while others tie it into one round bunch on the upper part of their heads, nearly as large as the head itself; and some into six or seven separate bunches. They use, for the purpose of daubing or smearing their hair, a greyish clay, mixed with shells reduced to powder, which they keep in balls, and chew into a sort of paste, whenever they intend to make use of it. This composition preserves the smoothness of the hair, and changes it, in process of time, to a pale yellow. Necklaces, consisting of strings of small variegated shells, are worn by both men and women. They also wear an ornament, about two inches in length, and half an inch in breadth, shaped like the handle of a cap, and made of stone, wood, or ivory, extremely well polished: this

is hung round the neck by fine threads of twisted hair, which are sometimes doubled an hundred fold. Some of them, instead of this ornament, wear a small human figure on their breast, formed of bone, and suspended in a similar manner. Both sexes make use of the fan, or fly-flap, by way of use and ornament. The most common sort is composed of cocoa-nut fibres, tied loosely in bunches, to the top of a polished handle. The tail-feathers of the cock, and those of the tropic-bird, are used for the same purpose. Those that are most in esteem, are such as have the handle formed of the leg or arm bones of an enemy killed in battle: these are preserved with extraordinary care, and are handed down, from father to son, as trophies of the highest value. The practice of tattooing, or puncturing the body, prevails among these people; and, of all the islands in this ocean, it is only at New-Zealand, and the Sandwich Isles, that the face is tattooed. There is this difference between these two nations, that the New-Zealanders perform this operation in elegant spiral volutes, and the Sandwich Islanders in straight lines that intersect each other at right angles. Some of the natives have half their body, from head to foot, tattooed, which gives them a most striking appearance. It is generally done with great neatness and regularity. Several of them have only an arm thus marked; others, a leg; some, again, tattoo both an arm and a leg; and others only the hand. The hands and arms of the women are punctured in a very neat manner; and they have a remarkable custom of tattooing the tip of the tongues of some of the females. We had some reason to imagine, that the practice of puncturing is often intended as a sign of mourning, on the decease of a chief, or any other calamitous occurrence: for we were frequently informed, that such a mark was in memory of such a chief; and so of the others. The people of the lowest order are tattooed with a particular mark, which distinguishes them as the property of the chiefs to whom they are respectively subject.

The common dress of the men of all ranks consists, in general, of a piece of thick cloth, called the maro, about a foot in breadth, which passes between the legs, and is fastened round the waist. Their mats, which are of various sizes, but, for the most part, about five feet in length, and four in breadth, are thrown over their shoulders, and brought forward before. These, however, are rarely made use of, except in time of war, for which purpose they appear to be better calculated than for common use, since they are of a thick heavy texture, and capable of breaking the blow of a stone, or of any blunt weapon. They generally go bare-footed, except when they travel over burnt stones, on which occasion they secure their feet with a kind of sandal, which is made of cords, twisted from cocoa-nut fibres. Besides their ordinary dress, there is another, which is appropriated to their chiefs, and worn only on extraordinary occasions. It consists of a feathered cloak and cap, or helmet, of uncommon beauty and magnificence. This dress having been minutely described, in a former part of our work, we have only to add, that these cloaks are of different lengths, in proportion to the rank of the person who wears them; some trailing on the ground, and others no lower than the middle. The chiefs of inferior rank have likewise a short cloak, which resembles the former, and is made of the long tail-feathers of the cock, the man-of-war bird, and the tropic-bird, having a broad border of small yellow and red feathers, and also a collar of the same. Others are composed of white feathers, with variegated borders. The cap, or helmet, has a strong lining of wicker-work, sufficient to break the blow of any warlike weapon; for which purpose it appears to be intended. These feathered dresses seemed to be very scarce, and to be worn only by the male sex. During our whole continuance in Karakakooa Bay, we never observed them used, except on three occasions; first, in the remarkable ceremony of Terrecoboo's first visit to our ships; secondly, by some chiefs, who appeared among the crowd on shore, when our unfortunate Commander was killed; and, thirdly, when his bones were brought to us by Eappo. The striking resemblance of this habit to the cloak and helmet which the

London: Published by Mrs. Hogg, at the King's Arms, No. 4, Paternoster Row.

Portrait of A MAN of the SANDWICH ISLANDS in a MASK. & Representation of A MAN of the SANDWICH ISLANDS DANCING.

the Spaniards formerly wore, excited our curiosity to enquire, whether there might not be some reasonable grounds for imagining that it had been borrowed from them. After all our endeavours to gain information on this head, we found, that the natives had no immediate acquaintance with any other people whatever; and that no tradition existed among them of these islands having ever before received a visit from such vessels as our's. However, notwithstanding the result of our enquiries on this subject, the form of this habit seems to be a sufficient indication of its European origin; particularly when we reflect on another circumstance, viz. that it is a remarkable deviation from the general agreement of dress, which is prevalent among the several branches of this great tribe, dispersed over the Pacific Ocean. From this conclusion, we were induced to suppose, that some Buccaneer, or Spanish ship, might have been wrecked in the neighbourhood of these islands. When it is considered, that the course of the Spanish trading vessels from Acapulco to Manilla, is not many degrees to the S. of Sandwich Isles, in their passage out, and to the N. on their return, this supposition will not, we think, be deemed improbable.

In the common dress of the men, and that of the women, there is very little difference. The latter wear a piece of cloth wrapped round the waist, which descends half way down their thighs; and sometimes, during the cool of the evening, they throw loose pieces of fine cloth over their shoulders, like the females of Otaheite. They have another kind of dress called the pan, which the younger part of the sex often wear: it consists of the thinnest and finest cloth, wrapped several times about the middle, and reaching down to the leg; so that it has the appearance of a full short petticoat. They cut their hair, and turn it up before, after the custom of the New Zealanders and Otaheiteans. One woman, indeed, whom we saw in Karakakooa Bay, had her hair arranged in a very singular manner: having turned it up behind, she brought it over her forehead, and doubled it back, so that it formed a kind of shade to the face, and somewhat resembled a small bonnet. Besides their necklaces, which are composed of shells, or of a shining, hard, red berry, they wear dried flowers of the Indian mallow, formed into wreaths, and likewise another elegant ornament, termed *eraie*, which is sometimes fastened round the hair in the manner of a garland, but is usually put round the neck; though it is worn occasionally in both these ways at once. It is a kind of ruff, about as thick as a finger, formed with great ingenuity, of very small feathers, woven closely together, insomuch, that the surface may be said to equal the richest velvet in smoothness. The ground is, in general, red, with alternate circles of black, yellow and green. We have already described their bracelets, of which they have a great variety. Some of the women of Atooi wear small figures of the turtle, made very neatly of ivory or wood, fastened on their fingers, in the same manner that rings are worn by us. They have likewise an ornament consisting of shells, tied in rows on a ground of strong net work, so as to strike against each other, while in motion; which both sexes, when they dance, fasten either round the ancles, or just below the knee, or round the arm. They sometimes, instead of shells, use for this purpose, the teeth of dogs, and a hard red berry. Another ornament, if it deserves that name, is a kind of mask, composed of a large gourd, having holes cut in it for the nose and eyes. The top of it is stuck full of green twigs, which appear at some distance, like a waving plume; and the lower part has narrow stripes of cloth hanging from it, somewhat resembling a beard. These masks we never saw worn but on two occasions, and both times by a number of persons assembled in a canoe, who approached the side of the ship, laughing and making droll gesticulations. We could never learn whether they were not also made use of as a defence for the head against stones, or in some of their public sports and games, or were disguised merely for the purposes of mummery and sport.

The natives of Sandwich Islands dwell together in small towns or villages, which contain from about 100

No. 74.

to 200 houses, built pretty close to each other, without order of regularity, and having a winding path that leads through them. They are flanked frequently, towards the sea side, with loose detached walls, which are, in all probability, intended for shelter and defence. Their habitations are of various dimensions, from 45 feet by 24, to 18 by 12. Some are of a larger size, being 50 feet in length, 30 in breadth, and entirely open at one end. These, we were informed, were designed for the accommodation of strangers or travellers, whose stay was likely to be short. Some of the best houses have a court-yard before them, railed in very neatly; with smaller habitations for servants erected round it: in this area the family usually eat and sit in the daytime. In the sides of the hills, and among the steep rocks, we saw several holes or caves, which seemed to be inhabited; but the entrance being defended by wicker-work, and, in the only one that we visited, a stone fence being observed running across it within, we supposed that they were chiefly intended as places of retreat, in case of an attack from enemies.

People of an inferior class feed principally on fish; and vegetables, such as plantains, bread-fruit, sweet potatoes, sugar-canes, yams, and taro. To these persons of superior rank add the flesh of dogs and hogs, dressed after the same method that is practiced at the Society Isles. They likewise sometimes eat fowls of a domestic kind; but these, however, are neither plentiful, nor in any degree of estimation. On our first arrival at these islands, yams, and bread-fruit, seemed scarce; but, on our second visit, we did not find this to be the case: it is therefore probable, that, as these vegetable articles are commonly planted in the interior parts of the country, the islanders might not have sufficient time for bringing them down to us, during our short continuance in Wymoa Bay. Their fish are salted, and preserved in gourd-shells, not, indeed, with a view of providing against an occasional scarcity, but from the inclination they have for salted provisions; for we found, that the chiefs had frequently pieces of pork pickled in the same manner, which they considered as a great delicacy. Their cookery is much the same as at the Friendly and Society Islands; and though some of our people disliked their taro puddings, on account of their sourness, others were of a different opinion. It is remarkable, that they had not acquired the art of preserving the bread-fruit, and making of it the four paste, named *maihee*, as is the practice at the Society Isles; and it afforded us great satisfaction, that we had it in our power to communicate to them this secret, in return for the generous treatment we received from them. At their meals they are very cleanly; and their method of dressing both their vegetable and animal food, was acknowledged universally to be superior to ours. The Erees begin constantly their meals with a dose of the extract of pepper root, or *ava*, prepared in the usual mode. The women eat apart from the other sex, and are prohibited, as before observed, from feeding on pork, turtle, and some particular species of plantains. Notwithstanding this interdiction, they would eat, privately, pork with us: but we could never prevail on them to taste the two latter articles of food. They generally rise with the sun; and having enjoyed the cool of the evening, retire to their repose a few hours after sun-set. The Erees are employed in making canoes, and mats; the Towtows are chiefly engaged in their plantations, and in fishing; and the women in the manufacture of cloth. They amuse themselves, in their leisure hours, with various diversions. The youth of both sexes are fond of dancing; and on more solemn occasions, they entertain themselves with wrestling and boxing matches, performed after the manner of the natives of the Friendly Islands; to whom, however, they are greatly inferior in these respects. Their dances, which bear a greater resemblance to those of the New Zealanders, than of the Friendly or Society Islanders, are introduced with a solemn kind of song, in which the whole number join, at the same time moving slowly their legs, and striking gently their breasts; their attitudes and manner being very easy and graceful. So

far they resemble the dancers of the Society Islands. After this has continued about the space of ten minutes, they quicken gradually their motions and the tune, and do not desist till they are oppressed with fatigue. This part of the performance is the counter-part of that of the inhabitants of New Zealand; and, as among those people, the person whose action is the most violent, and who continues this exercise the longest, is applauded by the spectators as the best dancer. It must be remarked, that, in this dance, the females only engage; and that the dances of the men resemble those we saw of the small parties at the Friendly Isles; and which may, perhaps, more properly, be termed the accompaniment of songs, with the correspondent motions of the whole body. But as we saw some boxing exhibitions, of the same kind with those we had seen at the Friendly Isles, it is not improbable, that they had here likewise their grand dances, wherein both men and women were performers. Their music, on these, and other occasions, is of a rude kind; for the only instruments, we observed among them, were drums of various sizes. Their songs, however, which they are said to sing in parts, and which they accompany with a gentle motion of their arms, like those of the inhabitants of the Friendly Isles, have a very pleasing effect.

These people are greatly addicted to gambling. One of their games resembles our game of draughts; but, from the number of squares, it seems to be much more intricate. The board is of the length of about two feet, and is divided into 238 squares, 14 in a row. In playing they use white and black pebbles, which they move from one square to another. They have a game which consists in concealing a stone under some cloth, spread out by one of the parties, and rumpled in such a manner, that it is difficult to perceive where the stone lies. The antagonist then strikes, with a stick, that part of the cloth where he supposes the stone to be; and the chances being, upon the whole, against his hitting it, odds of all degrees, varying with the opinion of the dexterity of the parties, are laid on the occasion. Their manner of playing at bowls nearly resembles that of ours. They often entertain themselves with races between boys and girls, on which they lay wagers with great spirit. We saw a man beating his breast, and tearing his hair, in the violence of rage, for having lost three hatchets at one of these races, which he had purchased from us with near half his property a very little time before. In swimming, both sexes are very expert; an art that, among these people, is deemed necessary, and is their favourite diversion. One particular method, in which we sometimes saw them amuse themselves, is worthy of notice. The surf, that breaks on the coast round this bay, extends about 150 yards from the shore; and within that space, the surges of the sea are dashed against the beach with extreme violence. Whenever the impetuosity of the surf is augmented to its greatest height, they make choice of that time for this amusement, which they perform in this manner: about 20 or 30 of the natives take each a long narrow board, rounded at both ends; and set out in company with each other from the shore. They plunge under the first wave they meet, and, after they have suffered it to roll over them, rise again beyond it, and swim further out into the sea. They encounter the second wave in the same manner with the first. The principal difficulty consists in seizing a favourable opportunity of diving under it; for, if a person misses the proper moment, he is caught by the surf, and forced back with great violence; and his utmost dexterity is required, to prevent his being dashed against the rocks. When in consequence of these repeated efforts, they have gained the smooth water beyond the surf, they recline themselves at length upon the boards, and prepare for their return to shore. The surf being composed of a number of waves, of which every third is observed to be considerably larger than the rest, and to flow higher upon the shore, while the others break in the intermediate space; their first object is to place themselves on the top of the largest surge, which drives them along with astonishing rapidity towards the land. If, by mistake,

they should place themselves on one of the smaller waves, which breaks before they gain the shore, or should find themselves unable to keep their board in a proper direction on the upper part of the swell, they remain exposed to the fury of the next; to avoid which, they are under the necessity of diving again, and recovering the place from whence they set out. Those who succeed in reaching the shore, are still in a very hazardous situation. As the coast is defended by a chain of rocks, with a small opening between them in several places, they are obliged to steer their plank through one of these openings; or, in case of ill success in that respect, to quit it before they reach the rocks, and, diving under the wave, make their way back again as well as they are able. This is considered as highly disgraceful, and is attended with the loss of the plank, which we have seen dashed to pieces, at the very instant the native quitted it. The amazing courage and address, with which they perform these dangerous achievements are almost incredible. The following accident evinces, at how early a period they are so far accustomed to the water, as to lose all apprehensions of its perils, and even set them at defiance. A canoe, in which was a woman and her children, happening to overset, one of the children, an infant of about four years old, appeared to be greatly delighted, swimming about at its ease, and playing a number of tricks, till the canoe was brought to its former position. Among the amusements of the children, we observed one that was frequently played at, and which shewed a considerable share of dexterity. They take a short stick, through one extremity whereof runs a peg sharpened at both ends, extending about an inch on each side, then throwing up a ball, formed of green leaves moulded together, and fastened with twine, they catch it on one of the points of the peg; immediately after which, they throw it up again from the peg, then turn the stick round, and catch the ball on the other point of the peg. Thus, for some time, they continue catching it on each point of the peg alternately, without missing it. They are equally expert at another diversion of a similar nature, throwing up in the air, and catching, in their turns, many of these balls; and we have often seen little children thus keep five balls in motion at once. This latter game is also practised by the young people of the Friendly Isles. The figure and dimensions of the canoes, seen by us at Atooi, have been already described. Those belonging to the other Sandwich Islands were made exactly in the same manner; and the largest we saw was a double one, the property of Terreeboob, measuring 70 feet in length, 12 in breadth, and between 3 and 4 in depth; and each was hollowed out of one tree. Their method of navigation, as well as that of agriculture, resemble those of the other islands in the Pacific Ocean. They have made considerable proficiency in the art of sculpture, and in painting or staining cloth. The most curious specimens of their sculpture, that we had an opportunity of observing, were the wooden bowls, in which the Erees drink ava. These are, in general, eight or ten inches in diameter, perfectly round, and extremely well polished. They are supported by three or four small human figures, represented in different attitudes. Some of them rest on the shoulders of their supporters; others on the hands, extended over the head; and some on the head and hands. The figures are very neatly finished, and accurately proportioned; even the anatomy of the muscles is well expressed.

Their cloth is manufactured in the same manner as at the Society and Friendly Islands. That which they intend to paint, is of a strong and thick texture, several folds being beaten and incorporated together; after which they cut it in breadths, two or three feet wide, and then paint it in a great variety of patterns, with such regularity and comprehensiveness of design, as shew an extraordinary portion of taste and fancy. The exactness with which the most intricate patterns are continued, is really astonishing, as they have no stamps, and as the whole is performed by the eye, with a piece of bamboo cane dipped in paint; the hand being supported by another piece of the same sort of cane. They

They extract their colours from the same berries, and other vegetable articles, which are made use of at Otaheite for this purpose. The operation of staining or painting their cloth, is confined to the females, and is denominated kipparee. They always called our writing by this name. The young women would frequently take the pen from our hands, and shew us that they were as well acquainted with the use of it as we ourselves; telling us, at the same time, that our pens were inferior to theirs. They considered a manuscript sheet of paper as a piece of cloth striped after the mode of our country; and it was with the greatest difficulty that we could make them understand that our figures contained a meaning in them, which theirs was destitute of. Their mats they make of the leaves of the pandanus; and these, as well as their cloths, are beautifully worked in various patterns, and stained with divers colours. Some of them have a ground of straw-colour, embellished with green spots: others are of a pale green, spotted with squares, or rhomboids, of red; and some are ornamented with elegant stripes, either in straight or waved lines of red and brown. In this branch of manufacture, whether we regard the fineness, beauty, or strength, these islanders may be said to excel the whole world. Their fishing hooks are of various sizes and figures; but those that are principally made use of are about two or three inches in length, and are formed in the shape of a small fish, serving as a bait, with a bunch of feathers fastened to the head or tail. They make their hooks of bone, mother-of-pearl, or wood, pointed and barbed with little bones, or tortoise-shell. Those with which they fish for sharks, are very large, being, in general, of the length of six or eight inches. Considering the materials of which these hooks are composed, their neatness and strength are amazing; and, indeed, upon trial, we found them superior to our own. Of the bark of the toota, or cloth-tree, neatly twisted, they form the line which they use for fishing, for making nets, and for some other purposes. It is of different degrees of fineness, and may be continued to any length. They have also a sort, made of the bark of a shrub, named areemah; and the finest is composed of human hair: this last, however, is chiefly made use of in the way of ornament. They likewise make cordage of a stronger kind, from cocoa-nut fibres, for the rigging of their canoes. Some of this, which was purchased by us for our own use, was found to be well calculated for the smaller kinds of running rigging. They also manufacture another sort of cordage, which is flat, and extremely strong, and is principally used for the purpose of lashing the roofs of their houses. This last is not twisted after the manner of the former sorts, but is formed of the fibrous strings of the coat of the cocoa-nut, plaited with the fingers, in the same manner which is practised by our seamen in making their points for the reefing of sails.

Their gourds are applied to various domestic purposes. These grow to such an enormous magnitude, that some of them will contain from ten to a dozen gallons. In order to adapt them the better to their respective uses, they take care to give them different shapes, by fastening bandages round them during their growth. Thus some of them are in the form of a dish, serving to hold their puddings, vegetables, and salted provisions: others are of a long cylindrical form, and serve to contain their fishing tackle; which two sorts are furnished with neat close covers, made also of the gourd. Others are in the shape of a long-necked bottle; and, in these water is kept. They score them frequently with a heated instrument, so as to communicate to them the appearance of being painted, in a great variety of elegant designs. Their pans in which they make their salt, are made of earth lined with clay, and are in general six or eight feet square, and about two thirds of a foot in depth. They are elevated on a bank of stones, near the high-water-mark, whence the salt water is conducted to the bottom of them, in trenches, out of which they are filled; and in a short time the sun performs the process of the evaporation. The salt we met with at Onecheow and Atooi, during our first visit, was brownish, and rather

dirty; but that which we afterwards procured in Karakakooa Bay, was white, and of an excellent quality. We obtained an ample supply of it, inasmuch that, besides the quantity used by us in salting pork, we filled all our empty casks with it.

The warlike weapons of the inhabitants of these islands are daggers, which they call by the name of pahooa, spears, slings, and clubs. The pahooa is made of a black, heavy wood, that resembles ebony. It is commonly from one to two feet in length, and has a string passing through the handle, by which it is suspended from the arm. The blade is somewhat rounded in the middle: the sides are sharp, and terminate in a point. This offensive weapon is intended for close engagements, and in the hands of the natives is a very destructive one. Their spears are of two kinds, and are formed of hard wood, which, in its appearance, is not unlike mahogany. One sort is from six to eight feet in length, well polished, and increasing gradually in thickness from the extremity till within the distance of six or seven inches from the point, which tapers suddenly, and has five or six rows of barbs. It is probable that these are used in the way of javelins. The other sort, with which the warriors we saw at Atooi and Owhyhee were chiefly armed, are from 12 to 15 feet in length, and instead of being barbed, terminate towards the point, in the manner of the daggers. Their slings are the same with our common ones, except in this respect, that the stone is lodged on matting, instead of leather. Their clubs are formed indifferently of several kinds of wood: they are of various sizes and shapes, and of rude workmanship.

The inhabitants of the Sandwich Islands are divided into three classes. The Erees, or chiefs of each district, are the first; and one of these is superior to the rest, who is called, at Owhyhee, Eree-taboo, and Eree-Moe, the first name expressing his authority, and the latter signifying that, in his presence all must prostrate themselves. Those of the second class appear to enjoy a right of property, but have no authority. Those who compose the third class, are called Towtows, or servants, and have neither rank nor property. The superior power and distinction of Terreeoboo, the Eree-taboo of Owhyhee, was sufficiently evident from his reception at Karakakooa, on his first arrival. The inhabitants all prostrated themselves at the entrance of their houses, and the canoes were tabooed, till he discharged the interdict. He was then just returned from Mowee, an island he was contending for, in behalf of his son, Teewarro, whose wife was the only child of the king of that place, against Taheeterree, his surviving brother. In this expedition he was attended by many of his warriors; but we could never learn whether they served him as volunteers, or whether they held their rank and property under that tenure. That the subordinate chiefs are tributary to him, is evidently proved in the instance of Kaoo, which has been already related. We have also observed, that the two most powerful chiefs of the Sandwich Islands, are Terreeoboo and Perréorannee; the former being chief of Owhyhee, and the latter of Woahoo; all the smaller isles being governed by one of these sovereigns: Mowee was, at this time, claimed by Terreeoboo, for his son and intended successor; Atooi and Onecheow being in the possession of the grandsons of Perréorannee. Without entering into the genealogy of the kings of Owhyhee and Mowee, it may be necessary to mention, that, when we were first off Mowee, Terreeoboo and his warriors were there, to support the claims made by his wife, his son, and his daughter-in-law; and a battle had then been fought with the opposite party, in which Terreeoboo had been victorious. Matters, however, were afterwards compromised; Taheeterree was to have possession of the three neighbouring islands, during his life; Teewarro to be acknowledged chief of Mowee, and to succeed to Owhyhee, on the death of Terreeoboo, together with the three islands contiguous to Mowee, after the decease of Taheeterree. Should Teewarro, who has lately married his half sister, die, and leave no issue behind him, those islands are to descend to Maihaimaiha, whom we have frequently mentioned, he being the

the son of Terreeoboo's deceased brother: and should he die without issue, it is doubtful who would be the successor, for Terreeoboo's two younger sons, being born of a mother who had no rank, would be debarred all right of succession. We did not see Queen Rorara, whom Terreeoboo had left at Mowee; but we had an opportunity of seeing Kance Kaberaia, the mother of the two youths of whom he was so extremely fond. From what has been already mentioned, it should seem that their government is hereditary; whence it appears probable, that the inferior titles, as well as property, descend in the same channel. Respecting Perreorannee, we only discovered that he is an Eree-taboo; that he was, on some pretence, invading the possession of Taheteerree; and that the islands to the leeward were governed by his grandsons.

The Erees appear to have unlimited power over the inferior classes of people; many instances of which occurred daily while we continued among them. On the other hand, the people are implicitly obedient. It is remarkable, however, that we never saw the chiefs exercise any acts of cruelty, injustice, or insolence towards them; though they put in practice their power over each other, in a most tyrannical degree: which the two following instances will fully demonstrate. One of the lower order of chiefs having shewn great civility to the master of our ship, when employed on the survey of Karakakooa Bay; Mr. King, some time afterwards, took him on board, and introduced him to Captain Cook, who engaged him to dine with us. While at table, Pareea entered, whose countenance manifested the highest indignation at seeing our guest so honourably entertained. He seized him by the hair of his head, and would have dragged him out of the cabin, if the Captain had not interfered. After much altercation, we could obtain no other indulgence (without quarrelling with Pareea) than, that our guest should be permitted to remain in the cabin, on condition that he seated himself on the floor, while Pareea occupied his place at the table. An instance somewhat similar happened when Terreeoboo came first on board the Resolution; where Maiha-maiha, who attended the king, seeing Pareea upon deck, turned him most ignominiously out of the ship; even though we knew Pareea to be a man of the first consequence in the island. Whether the lower class of people have their property secured from the rapacity of the great, we cannot possibly say, but it appears to be well protected against theft and depredation. All their plantations, their houses, their hogs, and their cloth, are left unguarded, without fear or apprehension of plunderers. In the plain country, they separate their possessions by walls; and, in the woods, where horse plantains grow, they use white flags to discriminate property, in the same manner as they do bunches of leaves at Otaheite. These circumstances strongly indicate, that, where property is concerned, the power of the Erees is not arbitrary, but so far limited, as to afford encouragement to the inferior orders to cultivate the soil, which they occupy distinct from each other.

The information we obtained, respecting the administration of justice is very imperfect. If a quarrel arose among the lower class of people, the matter was referred to some chief for his decision. When an inferior chief had offended one of superior rank, his punishment was dictated by, and the result of, the feelings of the superior at that moment. If the offender should fortunately escape the first transports of the great man's rage, he perhaps found means, through the mediation of friends, to compound for his offence, by all, or a part of his effects. As to the religion of these people, it resembles that of the Society and Friendly Islands. In common with each other, they have all their Morais, their Whattas, sacred orations, hymns, and sacrifices. These are convincing proofs that their religious rites and tenets are derived from the same source. The ceremonies here are, indeed, longer, and more numerous than in the islands above-mentioned; and though in all these places, the care and performance of their religious rites, is committed to a

particular class of people; yet we had never found a regular society of priests, till we arrived at Kakooa, in Karakakooa Bay. Orono was the title given to the principal of this order; a title which seemed to imply something sacred in a high degree, and which almost received adoration in the person of Omeeah. The privilege of holding the principal offices in this order, is doubtless limited to certain families. Omeeah, the Orono, was Kaa's son, and Kaireekeea's nephew; Kaireekeea presided in all religious ceremonies at the Morai, in the absence of his grandfather: it was observed, likewise, that the son of Omeeah, an infant of about the age of five years, had always a number of attendants, and such other marks of distinction and esteem were shewn him, as we never observed in any similar instances. Hence we concluded, that his life was an object of much consequence, and that he would eventually succeed to the high dignity of his father. The title of Orono, we have already observed, was bestowed on Captain Cook; and it is very certain, that they considered us as a race of beings superior to themselves; frequently repeating that the great Eatooa lived in our country. The favourite little idol on the Morai, before which Captain Cook fell prostrate, is called Koonoorackaiee, and is Terreeoboo's god, which they said resided also among us. An almost infinite variety of these images were to be seen, both on the Morais, and about their houses, on which they bestow different names; but they certainly were held in very little estimation; from their contemptuous expressions when speaking of, or to them, and from their exposing them to sale for mere trifles; though they generally had one particular figure in high favour, to which, while it continued a favourite, all their adoration was addressed. They arrayed it in red cloth, beat their drums, and chanted hymns before it; placed bunches of red feathers, and different vegetables at its feet; and frequently exposed a pig or a dog, to rot on the Whatta, near which it was placed. In a bay to the southward of Karakakooa, a party of us were conducted to a large house, in which we saw the figure of a black man, resting on his toes and fingers, and his head inclined backward: the limbs were well proportioned, and the whole was beautifully polished. This figure was called Mace; round which thirteen others were placed, with shapes rude and distorted. These, we were told, were the Eatoo's of deceased chiefs, whose names they repeated. Numbers of Whatta's were seen within this place, with the remains of offerings on many of them. They also have in their habitations many ludicrous and obscene representations by idols, not unlike the Priapus of the ancients. Former navigators have remarked, that the Society and Friendly Islanders pay adoration to particular birds, and it seems to be a custom prevalent in these islands: ravens may here, perhaps, be objects of worship; for Mr. King saw two of these birds perfectly tame, and was told they were Eatooas: that gentleman offered several articles for them, which were all refused; and he was particularly cautioned not to offend, or hurt them. Among their religious ceremonies may be classed the prayers and offerings made by their priests before their meals. As they always drink ava before they begin a repast, while that is chewing, the superior in rank begins a sort of hymn, in which he is soon after joined by one or more of the company; the bodies of the others are put in motion, and their hands are clapped together in concert with the fingers. The ava being ready, cups of it are presented to those who do not join in the hymn, which are held in their hands till it is concluded; when, with united voice, they make a loud response, and drink their ava. The performers are then served with some of it, which they drink, after the same ceremony has been repeated. And, if any person of a superior rank should be present, a cup is presented to him last of all; who having chanted for a short time, and hearing a response from others, he pours a small quantity on the ground, and drinks the rest. A piece of the flesh, which has been dressed, is then cut off, and together with some of the vegetables, is placed at the foot of the figure of the Eatooa; and, after another hymn

hymn has been chanted, they begin their meal. A ceremony, in many respects resembling this, is also performed by the chiefs, when they drink *ava* between their regular meals. According to the accounts given by the natives, human sacrifices are more common here than in any of the islands we have visited. They have recourse to these horrid rites, on the commencement of a war, and previous to a battle, or any signal enterprise. The death of every chief demands an offering of one or more *Towtows*; and we were informed not less than ten were devoted to suffer, on the decease of *Terrecoboo*, the king. But the unhappy victims are totally unacquainted with their ordained fate; which is, to be attacked with large clubs, wherever they may happen to be; and after they are dead, are conveyed to the place where the subsequent rites are to be performed. This brings to our remembrance the skulls of those who had been sacrificed on the decease of some principal chief, and were fixed to the *Morai* at *Kakooa*; at which village we received further information on this subject; for we were shewn a small piece of ground, within a stone fence, which we were told was a *Hereere*, or burying-place of a chief. The person who gave us this information, pointing to one of the corners, added; and there lie the *tangata* and *waheene-taboo*, or the man and woman who became sacrifices at his funeral. The knocking out their fore teeth, may be with propriety classed among their religious customs. Most of the common people, and many of the chiefs, had lost one or more of them; and this, we understood, was considered as a propitiatory sacrifice to the *Eatooa*, to avert his anger; and not like the cutting off part of the finger at the *Friendly Islands*, to express the violence of their grief at the decease of a friend. Concerning their opinions, respecting a future state, we had very defective information. Enquiring of them, whither the dead were gone? we were told, that the breath, which they seemed to consider as the immortal part, was fled to the *Eatooa*. They seemed also to give a description of some place, which they suppose to be the abode of the dead; but we could not learn, that they had any idea of rewards and punishments.

Here an explanation of the word *Taboo* may not be improperly introduced. On asking the reasons of the intercourse being interdicted, between us and the islanders, the day preceding *Terrecoboo's* arrival, we were informed, that the Bay was tabooed. The same interdiction took place, by our desire, when we interred the remains of *Captain Cook*. The most implicit obedience, in these two instances, was rendered by the natives; but whether on religious principles, or in deference to civil authority, we cannot pretend to determine. The ground whereon our observatories were fixed, and the place whereon our masts were deposited, were tabooed, and the operation was equally efficacious. This consecration was performed by the priests only; and yet, at our request, the men ventured on the spot which was tabooed; whence it should seem they entertained no religious apprehensions, their obedience being limited merely to our refusal. No inducements could bring the women near us; on account, it is presumed, of the *Morai* adjoining; which they are, at all times, prohibited from approaching; not only here, but in all the islands of the south seas, women, it has been observed, are always tabooed, or forbidden to eat certain articles of food. We have seen many of them, at their meals, have their meat put into their mouths by others; and, on our requesting to know the reason of it, we were informed, that they were tabooed, and not permitted to feed themselves. This prohibition was always the consequence of assisting at any funeral, touching a dead body, and many other occasions. The word *taboo*, is indifferently applied, either to persons or things; as the natives are tabooed, the bay is tabooed, &c. This word is also expressive of any thing sacred, devoted, or eminent. The king of *Owhyhee* is called *Eree-taboo*, and a human victim, *tangata-taboo*; and, among the *Friendly Islanders*, *Tonga*, where the king resides, is called *Tonga-taboo*.

With respect to their marriages, very little can be

said, except that such a compact seems to exist among them. It has already been mentioned, that, when *Terrecoboo* had left his queen *Rora-rora*, at *Mowee*, another woman cohabited with him, by whom he had children, and seemed particularly attached to her; but whether polygamy is allowed, or whether it is mixed with concubinage, either among the principal or inferior orders, we saw too little of, to warrant any conclusions. From what we observed of the domestic concerns of the lower class of people, one man and one woman seemed to have the direction of the house, and the children were subordinate to them, as in civilized countries. The following is the only instance of any thing like jealousy, which we have seen among them, and which shews, that, among married women of rank, not only fidelity, but even a degree of reserve, is required. At one of their boxing matches, *Omeah* rose two or three times from his place, and approaching his wife, with strong marks of displeasure, commanded her, as we supposed, to withdraw. Whether he thought her beauty engaged too much of our attention, or whatever might be his motives, there certainly existed no real cause of jealousy. She, however, continued in her place, and, at the conclusion of the entertainment, joined our party, and even solicited some trifling presents. She was informed that we had not any about us, but that, if she would accompany us to the tent, she should be welcome to make choice of what she liked. She was, accordingly, proceeding with us; which being observed by *Omeah*, he followed in a great rage, seized her by the hair, and, with his fists, began to inflict severe corporal punishment. Having been the innocent cause of this extraordinary treatment, we were exceedingly concerned at it; though we understood it would be highly improper for us to interfere between husband and wife of such superior rank. The natives, however, at length interposed, and, the next day, we had the satisfaction of meeting them together, perfectly satisfied with each other; besides, what was extremely singular, the lady would not permit us to rally the husband on his behaviour, which we had an inclination to do; plainly telling us, that he had acted very properly.

We had twice an opportunity, at *Karakakooa Bay*, of seeing a part of their funeral rites. Hearing of the death of an old chief, not far from our observatories, some of us repaired to the place, where we beheld a number of people assembled. They were seated round an area, fronting the house where the deceased lay; and a man, having on a red feathered cap, came to the door, constantly putting out his head, and making a most lamentable howl, accompanied with horrid grimaces, and violent distortions of the face. A large mat was afterwards spread upon the area, and thirteen women and two men, who came out of the house, sat down upon it in three equal rows; three of the women, and the two men being in front. The women had feathered ruffs on their necks and hands, and their shoulders were decorated with broad green leaves, curiously scolloped. Near a small hut, at one corner of this area, half a dozen boys were placed, waving small white banners, and taboo sticks, who would not permit us to approach them. Hence we imagined, that the dead body was deposited in the hut; but we were afterwards informed that it remained in the house, where the tricks were playing at the doorway by the man in the red cap. The company seated on the mat, sung a melancholy tune, accompanied with a gentle motion of the arms and body. This having continued some time, they put themselves in a posture between kneeling and sitting, and their arms and bodies into a most rapid motion, keeping pace, at the same time, with the music. These last exertions being too violent to continue, at intervals they had slower motions. An hour having passed in these ceremonies, more mats were spread upon the area, when the dead chief's widow, and three or four other elderly women came out of the house with slow and solemn pace; and, seating themselves before the company, began to moan most bitterly, in which they were joined by the three rows of women behind them; the two men appearing melancholy and pensive. They continued

with little variation, till late in the evening, when we left them; and, at day-light, in the morning, the people were dispersed, and every thing appeared perfectly quiet. We were then given to understand, that the body was removed; but we could not learn how it was disposed of. While we were directing our enquiries to this object, we were addressed by three women of rank, who signified to us, that our presence interrupted the performance of some necessary rites. Soon after we had left them, we heard their cries and lamentations; and, when we met them a few hours afterwards, the lower parts of their faces were painted perfectly black. We had also an opportunity of observing the ceremonies at the funeral of one of the ordinary class. Hearing some mournful cries, issuing from a miserable hut, we entered it, and discovered two women, whom we supposed to be mother and daughter, weeping over the body of a man who had that moment expired. They first covered the body with cloth: then lying down by it, they spread the cloth over themselves, beginning a melancholy kind of song, and repeating frequently *Aweh medoah! Aweh tance! Oh my father! Oh my husband!* In one corner of the hut a younger daughter lay prostrate on the ground, having some black cloth spread over her, and repeating the same expressions. On our quitting this melancholy scene, we found many of their neighbours collected together at the door, who were all perfectly silent, and attentive to their lamentations.

Mr. King was willing to have embraced this opportunity of knowing in what manner the body would be disposed of; and therefore, after being convinced that it was not removed till after he went to bed, he ordered the sentries to walk before the house, and if there were any appearances of removing the body, to acquaint him with it. The sentries, however, were remiss in the performance of their duty, for, before the morning, the body was taken away. On asking, how it had been disposed of, they pointed towards the sea, perhaps thereby indicating, that it had been deposited in the deep, or that it had been conveyed to some burying ground beyond the bay. The place of interment for the chiefs, is the morai, or herce erces, and those who

are sacrificed on the occasion, are buried by the side of them. The morai in which the chief was interred, who, after a spirited resistance, had been killed in the cave, is adorned with a hanging of red cloth round it. Having thus laid before our readers a circumstantial and comprehensive account of the whole group of the Sandwich Islands, we proceed to relate the transactions, incidents and events, during our second Expedition to the North, by the way of Kamtschatka, and on our return home, by the way of Canton, and the Cape of Good Hope, from March 1779, to August 1780. But it may not be amiss to close this chapter, with an abstract of the astronomical observations, which were made at the observatory in Karakakooa Bay, for determining its latitude and longitude; to which we shall add the latitude and longitude of the Sandwich Islands, collected into one point of view. The latitude of the observatory, deduced from meridian zenith distances of the sun, and some particular stars, we found to be 19 deg. 28 min. N. and its longitude, deduced from 253 sets of lunar observations, to be 204 deg. E.

C H A P. XVII.

The Resolution and Discovery, having weighed anchor, quit Oneecheow—A view of the coast of Kamtschatka—Enter the bay of Awatka—Descry the town of St. Peter and St. Paul—Party sent on shore—Their reception by the Commander of the port—Another party dispatched to Bolcheretsk, provisions, and stores being extremely scarce at St. Peter and St. Paul—Proceed up the river Awatka—Civility and hospitality from the inhabitants of the town of Karatchin—A journey on sledges—Curious account of that mode of travelling—Arrival at Natchekin—Embark on the Bolchoireka River—Formal procession into the capital—Hospitality and generosity of Major Behm, Commander of the Garrison—Bolcheretsk described—Affecting departure from that place—Return to the ships—Remarkable instance of generosity in the sailors—Major Behm carries dispatches to Petersburg—His departure and extraordinary character—Transactions at Petropaulovska—The Russian Hospital put under the care of our Surgeons—Difficulties in sailing out of the bay—Steer to the northward—Appearance of the country—Cheepoonskoi Nofs—Kronotskoi Nofs—Kamtschatkoi Nofs—Olutorikoi Nofs—And St. Thaddeus's Nofs, passed, and the errors of the Russian Charts pointed out.

ON Monday, the 15th of March 1779, we weighed anchor, and passing to the N. of Tahoora, stood to the S. W. in expectation of falling in with the island of MODOOPAPAPPA; the natives having assured us, that it lay in that direction, within five hours sail of Tahoora. The next day at five o'clock P. M. we made a signal for the Discovery to come under our stern, having given over all hopes of seeing MODOOPAPAPPA. On Wednesday, the 17th, we steered W. Captain Clerk intending to keep in the same parallel of latitude, till we made the longitude of Awatka Bay; and then to steer N. for the harbour of St. Peter and St. Paul, which was also fixed on as our rendezvous, if we should happen to separate. This track was chosen, because we supposed it to be yet unexplored, and we might probably meet with some new islands in our passage. On Tuesday, the 30th, the winds and unsettled state of the weather, induced Captain Clerke to alter his plan, and, at six in the evening, we began to steer N. W. which we

continued till Tuesday, the 6th of April, at which time we lost the trade wind. The fine weather we met with between the tropics, had not been idly spent. The carpenters found sufficient employment in repairing the boats. The best bower cable had been so much damaged that we were obliged to cut forty fathoms from it. The airing of sails and other stores, which from the leakiness of the decks, and sides of the ship, were perpetually subject to be wet, had now become a troublesome part of duty. For some time past, even the operation of mending the sailors old jackets, had risen into a duty both of difficulty and importance. It may be necessary to inform those who are unacquainted with the habits of seamen, that they are so accustomed, in ships of war, to be directed in the care of themselves by their officers, that they lose the very idea of foresight, and contract the thoughtlessness of infants. Had these people been left to their own discretion alone, the whole crew would have been very thinly clad, before the voyage

voyage had been half finished. It was natural to expect, that their experience, during the voyage to the N. last year, would have made them sensible of the necessity of paying some attention to these matters; but if such reflections ever occurred to them, the impression was so transient, that, upon returning to the tropical climates, their fur jackets, and the rest of their clothes, adapted to a cold country, were kicked about the decks as things of no value; though it was known in both ships, that we were to make another voyage towards the pole. They were, of course, picked up by the officers; and, being put into casks, restored about this time to the owners. In the afternoon of Wednesday, the 7th, we observed some of the sheathing floating by the ship; and, on examination, found that 12 or 14 feet had been washed off from under the larboard-bow, where the leak was supposed to have been; which, ever since leaving the Sandwich Islands, had kept our people almost constantly at the pumps, making 12 inches water in an hour; but, as we had always been able to keep it under with the hand-pumps, it gave us no great uneasiness, till Tuesday, the 13th, when, about six o'clock, P. M. we were greatly alarmed by a sudden inundation, that deluged the whole space between decks. The water which had lodged in the coal-hole, not finding a sufficient vent into the well, had forced up the platforms over it, and in a moment set every thing afloat. Our situation was now exceedingly distressing; nor did we perceive immediately any means of relief. At last we thought of cutting a hole through the bulk-head that separated the coal-hole from the fore-hold, and, by that means, to make a passage for the body of water into the well. As soon as a passage was made, the greatest part of the water emptied itself into the well, and enabled us to get out the rest in buckets; but the leak was now so much increased, that we were obliged to keep one half of our people pumping and baling constantly, till the noon of Thursday, the 15th. Our men bore, with great cheerfulness, this excessive fatigue, which was much increased by their having no dry place to sleep in; on which account they had their full allowance of grog. On Thursday, the 22nd, the cold was exceedingly severe; and the ropes were so frozen, that it was with difficulty they could be forced through the blocks. On Friday, the 23d, in latitude 52 deg. 9 min. longitude 160 deg. 7 min. we saw mountains covered with snow, and a high conical rock, distant about four leagues; and soon after this imperfect view we were enveloped in a thick fog. According to our maps, we were now but 8 leagues from the entrance of Awatika Bay; therefore when the weather cleared up, we stood in to take a nearer survey of the country. A most dismal and dreary prospect presented itself. The coast is straight, and uniform, without bays or inlets. From the shore, the ground rises in moderate hills, and behind them are ranges of mountains, whose summits penetrate the clouds. The whole was covered with snow, except the sides of some cliffs which rose perpendicularly from the sea. The wind blew strong from the N. E. with hazy weather and sleet, from the 24th to the 28th. The ship resembled a complete mass of ice; the shrouds being so incrustated with it, as to double their dimensions in circumference: in short, the experience of the oldest seaman among us had never met with such continued showers of sleet, and that extreme cold which we had now to encounter. Soon after our departure from Karakakooa Bay, Captain Clerke was taken ill, and during this run, the sea was in general so rough, and the Resolution so leaky, that the sail-makers had no place to repair the sails in, except the Captain's apartments, which in his declining state of health, was a serious inconvenience to him. At this time the inclemency of the weather, the difficulty of working our ships, and the incessant duty required at the pumps, rendered the service intolerable to the crew, some of whom were much frost bitten, and others were confined with colds.

Sunday, the 25th, we were favoured with a transient glance of the entrance of Awatika Bay; but, in the

present state of the weather, we could not presume to venture into it. For this reason we again stood off, when we lost sight of the Discovery; but this gave us little concern, being now so near the place of rendezvous. Wednesday, the 28th, in the morning, the weather cleared up, and we had a fine day, when our men were employed in taking the ice from the rigging, sails, &c. that in case of a thaw, which was now expected, it might not fall on our heads. At noon, in latitude 52 deg. 44 min. longitude 159 deg. the entrance of Awatika Bay, bore N. W. The mouth of it opens in the direction of N. N. W. On the S. side, the land is moderately high, rising to the northward into a bluff-head. Three remarkable rocks lie in the channel between them, not far from the N. E. side; and, on the opposite side, a single rock of considerable size. At three o'clock, P. M. we stood into the bay, with a fair wind from the southward, having from 22 to 7 fathoms soundings. There is a look-out house on the north-head, used as a light-house, when any of the Russian ships are expected upon the coast. It had a flag-staff, but we could not perceive any person there. Having passed the mouth of the bay, which extends about four miles in length, a circular basin presented itself of about 25 miles in circumference; in this we anchored about four o'clock; fearing to run foul of a shoal mentioned by Muller to lie in the channel. Great quantities of loose ice drifted with the tide in the middle of the bay, but the shores were blocked up with it. Plenty of wild fowl, of various kinds, were seen; also large flights of Greenland pigeons, together with ravens and eagles. We examined every corner of the bay, with our glasses, in order to discern the town of St. Peter and St. Paul, which, from the accounts we had received at Oonalashka, we supposed to be a place of strength and consequence. At length we discovered, to the N. E. some miserable log-houses, and a few conical huts, amounting, in the whole, to about 30, which, from their situation, notwithstanding all the respect we wished to entertain for a Russian Ostrog, or Town, we concluded to be Petropaulowska. In justice, however, to the hospitable treatment we found here, it may not be amiss to anticipate the reader's curiosity, by assuring him that our disappointment proved, in the end, a matter of entertainment to us. In this wretched extremity of the earth, beyond conception barbarous and inhospitable, out of the reach of civilization, bound and barricaded with ice, and covered with summer snow, we experienced the tenderest feelings of humanity, joined to a nobleness of mind, and elevation of sentiment, which would have done honour to any clime and nation.

On Sunday the 29th, in the morning, at day-light, Captain King was sent with the boats to examine the bay, and to present the letters to the Russian Commander, which he had brought from Oonalashka. Having proceeded as far as we were able with the boats, we got upon the ice, which extended near half a mile from the shore. The inhabitants had not yet seen either the ship, or the boats; for even after we had got upon the ice, we could not perceive any signs of a living creature in the town. We sunk at every step almost knee deep in the snow, and though we found tolerable footing at the bottom, yet the weak parts of the ice not being discoverable, we were constantly exposed to the danger of breaking through it. This accident, at last, actually happened to Captain King; who stepping on quickly over a suspicious spot, in order to press with less weight upon it, he came upon a second before he could stop himself, which broke under him, and in he fell. Fortunately he rose clear of the ice; and a man who was a little way behind with a boat hook, throwing it out, the Captain, by that means, was enabled to get upon firm ice again. The nearer we approached the shore, we found the ice still more broken. The sight of a sledge advancing towards us, however, afforded some comfort. But instead of coming to our relief, the driver stopped short, and called out to us. Captain King immediately held up Ismyloff's letters; in consequence of which, the man turned about, and drove full speed back

back again, followed with the execrations of some of our party. Unable to draw any conclusion from this unaccountable behaviour, we still proceeded towards the Ostrog, though with the greatest circumspection; and, when at the distance of about a quarter of a mile from it, we observed a body of armed men advancing to meet us. To avoid giving them any alarm, and to preserve the most peaceable appearance, the Captain, and Mr. Webber, marched in front, and the men, who had boat-hooks in their hands, were stationed in the rear. The armed party consisted of about 30 soldiers, headed by a person with a cane in his hand. Within a few paces of us he halted, and drew up his men in martial order. Captain King presented Ismyloff's letters to him, but in vain endeavoured to make him understand that we were English, and had brought these dispatches from Oonalahka. After an attentive examination of our persons, he conducted us towards the village in solemn silence, halting frequently his men, and ordering them to perform different parts of their manual exercise; with a view, as we supposed, to convince us, that if we should presume to offer any violence, we should have to deal with those who knew how to defend themselves. During the whole of this time, the Captain was in his wet clothes, shivering with cold; yet he could not avoid being diverted with this military parade, though it was attended by an unreasonable delay. Arriving, at length, at the habitation of the commanding officer of the party, we were ushered in; and, after giving orders to the military without doors, our host appeared, accompanied by the secretary of the port. One of the letters from Ismyloff was now opened, and the other sent express to Bolcheretsk, a town on the west side of Kamtschatka, and the place of residence of the Russian Commander of this province.

It appeared to us extraordinary, that the natives had not seen the Resolution the preceding day when we cast anchor, nor this morning, till our boats approached the ice. The first sight of the ship, we understood, had struck them with a considerable panic. The garrison was put instantly under arms; two field-pieces were placed before the Commander's house; and powder, shot, and lighted matches, were all in readiness. The officer who had conducted us to his dwelling, was a serjeant, and also the Commander of the Ostrog. After he had recovered from the alarm which our arrival had produced, the kindness and hospitality of his behaviour was astonishing. His house, indeed, was intolerably hot, but remarkably neat and clean. After Captain King had changed his clothes, by putting on a complete suit of the serjeant's, at his earnest request, which was doubtless the best he could procure; and, considering our visit was unexpected, was ingeniously conducted. To have made soup and bouillie would have required some time; instead therefore of this, we had some cold beef sliced, with boiling water poured over it. The next course was a large roasted bird, the taste of which was most delicious, though we were unacquainted with its species. Having eaten a part of this, it was removed, and fish was served up, dressed in two different ways. Soon after which, the remainder of the bird appeared again in savoury and sweet pates. Our liquor was what the Russians distinguish by the name of quafs, and was the most indifferent part of our entertainment. The serjeant's wife served up several of the dishes, and was not permitted to sit down at table with us. Our repast being finished, during which our conversation was limited to a few bows, and other personal tokens of mutual respect, we strove to explain to our host the occasion of our visit to this port. Probably, Ismyloff's letters we had delivered made him readily comprehend our meaning; but as there was not a person in the place, who understood any other languages than those of Russia or Kamtschatka, we found it extremely difficult to comprehend what he endeavoured to communicate to us. Having spent much time in our attempts to understand each other, the sum of the intelligence we had received appeared to be, that though we could not be supplied with provisions or stores at this

place, yet those articles were to be procured in great plenty at Bolcheretsk. That he doubted not, but the Commander would readily supply us with what we wanted; but that, till he received his orders, neither he, nor any of the natives could even venture on board the vessel. It being now time for us to depart, and as Mr. King's clothes were not yet dry, he had again recourse to the serjeant's benevolence, for his permission to carry those on board which he had borrowed of him. This request was cheerfully complied with, and a sledge, with five dogs and a driver, was instantly provided for each of our party. This mode of conveyance afforded high entertainment for the sailors; and they were delighted still more, when they found that the two boat-hooks had a sledge appropriated solely for their conveyance. These sledges are so light, and so admirably well constructed for the purposes intended, that they went safely and expeditiously over the ice, and over parts of it which we should have found extremely difficult to have passed on foot. On our return, the boats were towing the Resolution towards the village; and, at seven, we moored close to the ice; the entrance of the Bay bearing S. by E. and the Ostrog N. distant one mile and a half. On Friday, the 30th, the casks and cables were taken to the quarter-deck, to lighten the vessel forward, and the carpenters proceeded to stop the leak which had occasioned us so much trouble. In the middle of the day we had such warm weather, that the ice began to break away very fast, and almost choked up the entrance of the bay. Several of our officers waited upon the serjeant, who received them with great civility; and Captain Clerke sent him a present of two bottles of rum, thinking he could not send him any thing more acceptable. In return, he received twenty fine trouts, and some excellent fowls of the grouse kind. Though the Bay swarmed with ducks and Greenland pigeons, our sportsmen had no success; for, being exceedingly shy, they could not kill any.

On Saturday, the 1st of May, in the morning, we saw our consort, the Discovery, standing into the Bay: a boat was immediately dispatched to her assistance, and she was moored in the afternoon close by the Resolution. On the 3d, in the morning, two sledges having been observed to drive into the village, Mr. King was ordered on shore, to learn whether an answer was arrived from the Commander of Kamtschatka. The distance from Bolcheretsk to St. Peter and St. Paul's is 135 English miles. The dispatches were sent off in a sledge, drawn by dogs, on the 29th, at noon, and returned with an answer early this morning; so that they performed a journey of 270 miles in little more than three days and a half. For the present, the return of the Commander's answer was concealed from us. While Mr. King was on shore, his boat, and another belonging to the Discovery, were bound fast to the ice. In this situation, the Discovery's launch was sent to their assistance, which soon partook of the same fate: but on the 4th, the floating ice was drifted away, by the wind changing, and the boats were set at liberty, without sustaining the smallest damage. At 10 o'clock A. M. several sledges having arrived at the edge of the ice, a boat was sent from the ship to conduct those who were in them on board. One of them proved to be a Russian merchant from Bolcheretsk, whose name was Fedofitch; and the other a German, named Port, with dispatches from Major Behm, Commander of Kamtschatka, to Captain Clerke. Arriving at the edge of the ice, and seeing distinctly the magnitude of the ships, within 200 yards of them, they were exceedingly alarmed; and before they ventured to embark, stipulated that two of our boat's crew should remain on shore, as hostages for their safety. It afterwards appeared, for what reasons we could not conceive, that Ismyloff, in his letter to the Commander, had mentioned our ships as two small trading vessels; and that the serjeant, having seen them at a distance only, had not rectified the mistake. When they had arrived on board, we perceived, by their timid behaviour, that they entertained some very extraordinary apprehensions. However, an uncommon degree of satisfaction was visible

sible in their countenances, when the German found a person among us, with whom he could enter into conversation. Mr. Webber spoke that language fluently, and convinced them, though not without difficulty, that we were Englishmen and friends. Mr. Port was introduced to Captain Clerke, to whom he delivered the Commander's letter. It was written in the German language, and merely complimentary, giving him and his officers an invitation to Bolcheretsk. Mr. Port, at the same time, acquainted him, that the Major had conceived a very wrong idea of the size of the ships, and of the service they were engaged in; Ismyloff, in his letter, having represented them as two small packet-boats, and cautioned him to be on his guard, insinuating, that he suspected us to be no better than pirates. In consequence of this letter, he said, there had been various conjectures formed about us at Bolcheretsk. We were much diverted with the fears and apprehensions of these people; and especially with an account given by Mr. Port, of the serjeant's extreme caution the day before. On seeing Mr. King and some other gentlemen come on shore, he concealed him and the Russian merchant in the kitchen, to give them an opportunity of listening to our conversation with each other, in order to discover whether we were Englishmen or not.

Being now enabled, by the aid of an interpreter, to converse with the Russians, our first enquiries were directed to the means of procuring a supply of fresh provisions and naval stores; particularly the latter, for the want of which we had been in great distress. On enquiry, it appeared, that the whole stock of live cattle, which the country about the Bay could furnish, amounted only to two heifers; and these the serjeant very readily promised to secure for us. Our next applications were made to the merchant, whose terms for serving us were so exorbitant, that Captain Clerke thought it expedient to send an express to the Commander, to learn the price of stores at Bolcheretsk. This determination being communicated to Mr. Port, he dispatched a messenger to the Commander at Bolcheretsk, to acquaint him with our intentions, and to remove the suspicions that had been entertained respecting the purposes of our voyage. For the above service Mr. King was fixed upon, and ordered to prepare for setting out the next day, together with Mr. Webber, who was to accompany him as interpreter. That day, and the next, however, the weather proved too stormy for beginning a journey through so desolate and wild a country: but on Friday, the 7th of May, the weather became more favourable, and we set out in the ship's boats, early in the morning, in order to reach the entrance of the Awatka at high-water, on account of the shoals at the mouth of that river. The country boats were to meet us here, to conduct us up the stream. Captain Gore was also added to our party, and we were likewise accompanied by Mr. Port and the Russian merchant, with two Cossacks, having been previously furnished with warm furred cloathing; a very necessary precaution, as it began to snow briskly immediately after our setting out. About eight o'clock, we were stopped by shoal water, within a mile of the mouth of the river; when some Kamtschadales took us and our baggage, in some small canoes, and conveyed us over a bank of sand, which the rapidity of the river had thrown up, and which, we were informed, was continually shifting. Having passed this shoal, the water again deepened, and we were furnished with a commodious boat, resembling a Norway yawl, to convey us up the river, together with canoes for the reception of our baggage. The breadth of the mouth of Awatka is about a quarter of a mile, but it gradually narrowed as we advanced. Having proceeded a few miles, we passed several branches, many of which, we were told, emptied themselves into other parts of the Bay; and that some of those on the left ran into the Paratounca river. For the first 10 miles, the general direction of the river from the Bay, is to the N. and afterwards it turns to the westward. Except this bend, it chiefly preserves a straight course; and flows through a low flat country, to

the distance of 30 miles from the sea, which is subject to frequent inundations. Six men were employed in pushing us on with long poles, three of them being at each end of the boat; and proceeded against the stream, at the rate of about three miles an hour. Our conductors endured this severe labour for 10 hours; stopping only once, and that for a short space of time, to take a little refreshment. Having been informed, at our first setting out, that we could easily reach Karatchin that night, we were greatly disappointed to find ourselves 15 miles from that place at sun-set. This was attributed to the delay in passing the shoals, both at the entrance of the river, and in many other places. Our men being exceedingly fatigued, and as the difficulty of navigating the river would have increased by the darkness of the night, we declined all thoughts of proceeding on our journey that evening: we therefore fixed upon a place that was tolerably well sheltered, and, clearing it of the snow, erected a small *marquée*, which we had providentially taken with us; and, with the assistance of a good fire, and some excellent punch, passed the night agreeably. Our principal inconvenience was, the being obliged to keep at a considerable distance from the fire; for as soon as it was lighted, it thawed every part round it into an absolute puddle. The Kamtschadales were extremely alert and expeditious in erecting our *marquée*, and cooking our provisions; but we were much surprized at finding they had brought with them their utensils for making tea, considering it as a most intolerable hardship if they cannot, two or three times a day, regale themselves with drinking tea. When day-light appeared, we proceeded on our journey, and, before we had made much progress, were met by the Toion, or chief of Karatchin, who, being apprized of our coming, had provided canoes that were better accommodated for navigating the higher parts of the river. A commodious vessel, (made by lashing two canoes together) furnished with fur cloaks, and lined with bear-skins, was also procured for us. We now proceeded rapidly, the Toion's people being remarkably expert in this kind of business. At ten we arrived at the Ostrog, named Karatchin, and the seat of his command, where we were received by the Kamtschadale men and women, and some Russian servants belonging to the merchant, Fedositch. They were all attired in their best habiliments; those of the women being gay and pleasing, and consisting of a loose robe of white nankeen, gathered close round the neck, and fastened with a silk collar. A short jacket, without sleeves, was worn over this, consisting of different coloured nankeens; and they had petticoats made of a slight Chinese silk. Their shifts, which were also made of silk, had sleeves extending to the wrists; and their heads were bound with coloured silk handkerchiefs, which entirely concealed the hair of the married women; but the unmarried ones placed the handkerchief under the hair, permitting it to flow loosely down the shoulders.

The Ostrog of Karatchin is pleasantly situated on the side of the river, and composed of three log-houses, nineteen *balagans*, or summer habitations, and three *jourts*, which are houses under ground. The Toion, to whose dwelling we were then conducted, was a plain decent man, sprung from a Russian mother, and a Kamtschadale father. His house, like all others in this country, consisted of only two apartments. All the furniture in the outer room, was a long narrow table, with a bench round it; and the inner apartment, which was the kitchen, was also very scantily furnished. But, the hearty welcome, and kind attention of our host, amply compensated for the poverty of his habitation. His wife, an excellent cook, served us with various sorts of fish and game, and different kinds of heath-berries, which had been preserved since the last year. Whilst we were dining in this miserable hut, the guests of absolute strangers, and at the extremity of the habitable globe, a solitary half-worn pewter spoon attracted our attention. Its form was familiar to us, and the word London was stamped upon the back of it. It is impossible to express the anxious hopes, and tender re-

membrances,

membrances, this circumstance excited in us. Those who have been long absent from their native country, will readily conceive what inexpressible pleasure such trifling incidents can give.

We had now quitted the river, and the next part of our journey was to be performed on sledges; but the thaw had been so great in the day-time, as not to permit us to set out, till the snow was become hard and firm by the coldness of the evening. This furnished us with an opportunity of walking about the village, which was the only place in this country, that we had seen free from snow. It was situated on a flat, of about a mile and an half in circuit. The leaves of the trees were just budding, and the verdure was strongly contrasted with the surrounding hills, which remained covered with snow. The soil appearing to be capable of producing common vegetables, we were surprized to find that not a spot of it was cultivated. Neither were the inhabitants possessed of cattle of any sort. In short, their situation, during the winter months, must be wretched beyond conception. They were now removing from their jouts to their balagans, which gave us an opportunity of observing both these sorts of habitations. The people invited us, very civilly, into their houses; cheerfulness and content were visible in every countenance, to which the approaching change of season might perhaps contribute. On returning to our host's, supper was prepared for us, consisting of the same articles which composed our former repast. When we had finished our meal, we entertained the Toion and his wife with punch made of some of our spirits; and Captain Gore, with his wonted generosity, made them some valuable presents: after which, they retired to the kitchen, leaving us in the other room; on the benches of which we spread our bear-skins, and sought a little repose; having first settled with our conductors, to proceed on our journey, when the ground was judged to be in a suitable condition. The melancholy howlings of the dogs awakened us about nine the same evening. During the whole time our baggage was lashing upon the sledges, their horrid noise continued; but, when they were yoked, and prepared for travelling, a cheerful yelping succeeded, which ceased the instant they marched off. We shall here give our readers an accurate description of a sledge brought over by Captain King, and now in the possession of Sir Ashton Lever. The length of the body is about four feet and an half, and the breadth one foot. It is made in the form of a crescent, of light tough wood, fastened together with wicker work; and, among the principal people, is elegantly stained with red and blue; the seat being covered with furs or bear-skins. It has four legs, about two feet in height, resting on two long flat pieces of wood, of the breadth of five or six inches, extending a foot beyond the body of the sledge, at each end. These turn up before, somewhat like a skait, and are shod with the bone of some sea-animal. The carriage is ornamented, at the fore part with tassels of coloured cloth, and leather thongs. It has a cross bar, to which the harness is joined; and links of iron, or small bells, are hanging to it, which, by the jingling, is supposed to encourage the dogs. They seldom carry more than one person at a time, who sits aside, with his feet on the lower part of the sledge, having his baggage and provisions, in a bundle behind him. The usual number of dogs employed in drawing this carriage, is five; four of them yoked two and two, and the other acting as leader. The reins, being fastened to the collar, instead of the head, have no great command: and are therefore usually hung upon the sledge; the driver depending principally on their obedience to his voice. Great care and attention are consequently used in training up the leader, which frequently becomes very valuable on account of his steadiness and docility; the sum of forty roubles (or ten pounds) being no unusual price for one of them. The rider has also a crooked stick, answering the purpose both of whip and reins; with which, by striking in the snow, he can regulate the speed of the dogs, or even stop them at his pleasure.

When they are inattentive to their duty, he often chastises them by throwing it at them. The dexterity of the riders, in picking this stick up again, is very remarkable, and is the most difficult manœuvre in the exercise of their profession: nor is it, indeed, surprising that they should be skilful in a practice in which they are so materially interested; for, they assured us, that if a driver should happen to lose his stick, the dogs immediately discover it; and, unless their leader is both steady and resolute, they will instantly set off full speed, and never stop till their strength is exhausted; or till the carriage is overturned and dashed to pieces, or hurried down a precipice, when all are buried in the snow. The accounts of the speed of these animals, and of the hardships and fatigues they suffer, would have appeared incredible, had they not been supported by the greatest authority. We ourselves were witnesses of the extraordinary expedition with which the messenger returned, who had been dispatched to Bolcheretsk with the news of our arrival at St. Peter and St. Paul's, though the snow was exceedingly soft. The Governor of Kamtschatka assured us, that this journey was usually performed in two days and an half; and that he had once received an express from that harbour in 23 hours. Throughout the winter, the dogs are fed on the offals of dried and stinking fish; and, even this miserable food is withheld from them, a day before they set out on a journey; and they are not permitted to eat a morsel of any thing till they arrive at the end of it. They are frequently kept fasting for two entire days, in which time they will perform a journey of great extent. The shape of these dogs resembles that of the Pomeranian breed, but they are considerably larger.

As we did not chuse to rely upon our own skill, we had each of us a man to conduct the sledge, which, in the condition the roads then were, proved a very laborious business: for, as the thaw had been prevalent in the vallies, through which was our regular road, we were obliged to travel along the sides of the hills; our guides being under the necessity of supporting the sledges, on the lower sides, with their shoulders, for many miles together. Mr. King was attended by a good-natured Collack, who was so imperfect in his business, that he was continually overturned, which afforded entertainment to his companions. The party consisted of ten sledges in the whole. That which conducted Captain Gore, was formed of two lashed together, and was plentifully furnished with furs and bear-skins. It was drawn by ten dogs, yoked four abreast; and those which were laden with heavy baggage, were drawn by the same number. We had not proceeded more than four miles on our journey, when it began to rain, which, together with the darkness of the night, threw us into some confusion. It was, after some little consultation, agreed, that we should continue where we were, till day-light; we therefore secured our sledges, wrapped ourselves up in furs, and waited patiently for the morning. At three o'clock we were summoned to proceed; our guides expressing their apprehensions, that if we waited any longer, the thaw would perhaps stop us, and prevent our advancing or returning. Though we had many difficulties to encounter, owing principally to the bad condition of the road, we got safe to an ostrog about two in the afternoon. It is called Natchekin, and is situated on a small stream, which falls into the Bolchoireka, at some distance below the town. It is 25 miles from Karatchin; which, by their account, we could have compassed in four hours, had the frost continued; but the snow was so soft that the poor animals sunk up to their bellies at almost every step; and it was indeed surprizing that they should be able to support themselves under so fatiguing a journey. This inconsiderable ostrog consists of one log-house, the residence of the Toion, one jout, and five balagans. We were received here with the same civility and hospitality as at Karatchin; and, in the afternoon, were conducted to a remarkable hot spring, at a small distance from this village. Before we came very near it, we saw a rising steam from it, as from a boiling

THE HISTORY OF THE ARTS AND MANUFACTURES OF GREAT BRITAIN

BY J. H. MILLAR

1793

boiling caldron; and, when we approached it, we perceived a strong sulphureous effluvia. A basin of about three feet in diameter, is formed by the main spring; besides which, there are several lesser springs, of equal heat, in the adjacent ground; by which means the whole spot, consisting of about an acre, was so very hot that we could not remain two minutes in the same place. The water issuing from these springs, supplies a small bathing pond, and afterwards a little rivulet, which conducts it into the river, at the distance of about 150 yards. Great cures, they informed us, had been effected by this bath, in rheumatisms, scorbutic ulcers, swelled and contracted joints, and many other disorders. Where these springs flow, the ground is on a gentle ascent; having a green hill of a moderate size behind it. Some plants seemed to thrive here with great luxuriance, among which we observed the wild garlick.

Monday, the 10th, in the morning, we embarked on the Bolchoireeka; and, going with the stream, expected to arrive at our journey's end the following day. Though Bolcheretk is 80 miles from Natchekin, we were informed, that, in the summer, when the melting of snow on the mountains has rendered the river full and rapid, the canoes have often gone there in a single day: but now they told us we should be much longer, the ice having broken up only three days before our arrival, and our's being the first boat that had attempted to pass. There was but too much truth in this intelligence; for we were greatly impeded by the shallows; and, though the stream was rapid in many places, we frequently had ripplings and shoals, and were under the necessity of hauling the boats over them. On each side of the river, the country was romantic, but not diversified; the course of it being between craggy mountains, of a most dreary and barren aspect; with nothing to vary the scene, except now and then the sight of a bear, or a flock of wild-fowl. This, and the following night, we slept under our marquée, on the banks of the river, and suffered greatly from the severity of the weather.

Wednesday the 12th, at day-light, we had passed the mountains, and were proceeding through a low extensive plain, on which were a number of shrubby trees. At nine in the morning, we reached an ostrog, called Opatchin, of about the same magnitude as Karatchin, and supposed to be 50 miles from Natchekin. A serjeant and four Russian soldiers had been here two days, waiting for our arrival; who instantly dispatched a light boat to Bolcheretk to give intelligence of our approach. A magnificent canoe, plentifully furnished with skins and furs, was prepared for our reception, and we were very commodiously equipped; but our fellow-travellers were excluded. It gave us some concern to be separated from our old companion Mr. Port, who daily grew more shy and distant, as we drew nearer to the completion of our journey. He acknowledged, indeed, before we set out, that he was not entitled to the respect we had shewn him; but, finding him discreet, and not presuming, we had insisted on his faring as we did, throughout the journey. We performed the remainder of our passage, with the utmost ease and expedition; for as we descended, the river grew more rapid, and had very few obstructions. On our approaching Kamtschatka, we judged, from an appearance of great stir and bustle, that our reception was to be in form. This circumstance was disagreeable to us, as decent cloathing had long been scarce among us; and our traveling habits formed a strange assemblage of the modes of India, Europe, and Kamtschatka. To make a parade through the metropolis in this motley trim, we thought would appear ridiculous; and, as we observed a crowd of people collected on the banks of the river, and were informed that the commander would receive us at the water-side, we stopped at the house of a soldier, about a quarter of a mile before we came to the town. Here we dispatched Mr. Port with a message to his excellency, acquainting him, that, as soon as we had put off our travelling dresses, we would attend him at his own house to pay our respects to him; and entreated him not to think of waiting to conduct us. He persisted, however, in his resolution of paying us

this compliment, and we immediately proceeded to join him at the entrance of the capital. We were all remarkably awkward and defective in making our first salutations; not having been accustomed to bowing and scraping, for at least two years and an half. The commander received us in a most engaging manner; but we had the mortification to discover, that he had almost wholly forgot the French language; so that only Mr. Webber had the satisfaction of conversing with him, as he spoke the German, which was his native tongue. Major Behm was accompanied by Captain Shmaleff, the next in command, and another officer; the whole body of merchants attended also. We were conducted to the commander's house, where we were politely and respectfully received by his lady; who had prepared tea and other refreshments for us. The first compliments being over, Captain Gore desired Mr. Webber to acquaint the Major, that we were distressed for want of naval stores, fresh provisions, flour, and other necessities; and that we were convinced we could not receive much assistance from him, in the country about Awatka Bay, from what we had already seen and heard; that the impossibility of conveying heavy stores over the peninsula, at that season, we were but too sensible of, from the difficulties we had encountered in our journey; and that we could not delay the prosecution of our voyage, to wait for any material change. Here the Major interrupted Mr. Webber, by observing, that we knew not what they were capable of doing; that he should not bestow a thought upon the difficulties of supplying our wants: he only wished to know what articles we stood in need of, and the time he could be allowed for procuring them. After expressing our acknowledgments for his obliging condescension, we presented him an account of the naval stores, cattle, and flour, we were directed to purchase; and informed him, that we intended to prosecute our voyage about the 5th of June. After this, the conversation became more general, and it might naturally be supposed, that we were anxious to obtain some information respecting our native country. Having been three years absent, we entertained the most flattering expectations, of receiving some interesting intelligence from Major Behm: but we were greatly disappointed, when he assured us, that he could not communicate any intelligence of a much later date than that of our quitting England. The commander, supposing we might be fatigued, and desirous of repose, begged leave to conduct us to our lodgings, at about seven o'clock. It was useless to protest against a compliment, to which we had no other title than that of being strangers. That alone, with this generous Livonian, was sufficient to counterbalance every other consideration. In going along, we passed two guard-houses, where the men were under arms, in compliment to Captain Gore, and were conducted to a neat decent house, which the Major had appointed for our residence, while we continued at Kamtschatka. We had two sentinels posted at our door, and a serjeant's guard in an adjoining house. Having disposed of us in our apartments, the Major took his leave, promising to visit us the next day. We were now at leisure to discover the conveniences which he had amply provided for us. Our fellow traveller, Mr. Port, and a soldier, of a rank between that of a serjeant and a corporal, (called a *pulproperckack*) were fixed upon to be our male domestics. We had also a housekeeper, and a cook, who were ordered to obey Mr. Port's directions in dressing us a supper, after the English mode of cookery. In the course of the evening, we were favoured with a number of civil messages, from the principal inhabitants of the town, politely observing, that their attending to pay their respects to us at that time, would add to our fatigues, but they would do themselves that honour the next morning. Such attention and politeness, in so uncultivated and desolate a country, formed a contrast highly in favour of its inhabitants; and, in addition to their civility, at sun-set, the serjeant brought the report of his guard to Captain Gore. In the morning of the 13th, compliments were sent us by the Major, Captain Shmaleff, and the most respectable

spectable people of the town, from all whom we were honoured with visits soon after. The two former having, after we had retired to rest, enquired of Mr. Port what articles we stood in the greatest need of on board the ships; they insisted on our sharing with their garrison, in the small stock of provisions they had then remaining; lamenting, at the same time, that our arrival should happen to be in that season of the year, when scarcity reigned universally among them; the sloops from Okotsk not being yet arrived with their annual supply. We thankfully accepted the liberal offer of these hospitable strangers; on condition, however, that we should be made acquainted with the price of the articles we received from them, that Captain Clerke might draw upon the Victualling Office, in London, for the amount. This was refused in the most positive terms; and, though repeatedly urged, the Major always stopped us short, by saying, that his mistress would be highly gratified at his rendering every assistance in his power to the English, who are her good friends and allies; and that it would give her a peculiar satisfaction to find, that, in such remote regions, her dominions had afforded any relief to vessels engaged in such important services. He added, that he could not, therefore, act so contrary to the principles of his Empress, as to think of receiving any bills; but, if we insisted on it, we might give him a bare certificate of the articles he might supply us with, which he would transmit to the court of Russia, as evidence of having performed his duty. All farther acknowledgments, continued he, must be submitted to the two courts; but you must excuse me from acceding to your proposal. This matter being adjusted, he requested to be informed respecting our private wants, saying he should consider it as offering him an affront, if we applied to any of the merchants, or had dealings with any other person except himself.

Not having it in our power to make an adequate return for such singular generosity, he had only our thanks and admiration. At this moment, Mr. King recollected, that Captain Clerke had sent by him a set of the engravings to Captain Cook's second voyage, desiring him to present it, in his name, to the commander. Nothing could have been more acceptable to him than this present, the Major being an enthusiast in all matters relative to discoveries. Captain Clerke had also given Mr. King a discretionary power, of permitting the commander to see a chart of the discoveries made in the present voyage; and, judging from his situation and disposition of mind, that he would be highly gratified by such a communication; though, from motives of delicacy, he had only asked a few general questions on the subject, Mr. King reposed in him that confidence, which his whole conduct so justly merited. He felt this compliment as it was intended he should, and was struck at beholding, in one view, the whole of that coast on the side of Asia and America, which his countrymen had been so long employed in acquiring an imperfect knowledge of. Except this mark of confidence, and the set of copper-plates already mentioned, we had nothing with us deserving of his acceptance; for it was hardly worth noticing, that Mr. King prevailed on his son (who was quite a youth) to accept of a silver watch; and contributed to his little daughter's happiness, by presenting her with two pair of ear-rings, of French paste. He also gave Captain Shmaleff the thermometer which he had used on his journey, when he engaged to keep a register of the temperature of the air for one whole year, and to transmit it to Mr. Muller, with whom he was acquainted. This day we dined at the commander's, who, ever studious to gratify our curiosity, had prepared variety of dishes dressed after the Russian and Kamtschadale manner, besides a number of others in the English style. In the afternoon, we took a survey of the town, and the adjacent country. The situation of Bolcheretsk is in a low swampy plain, extending to the sea of Okotsk, being about 40 miles in length, and of a considerable breadth. It lies north of the Bolchoi-reka, (or great river) and on a peninsula, which has been separated

from the continent by a large canal, under the directions of the present commander; which has added strength to it as a fortress, and rendered it much less subject to inundations. The depth of the river, below the town, is from six to eight feet, and the breadth about a quarter of a mile. At the distance of 22 miles, it empties itself into the sea of Okotsk, where it is capable of admitting pretty large vessels. No corn, of any kind, is cultivated in this part of the country; and the Major assured us, that his was the only garden that had been planted. In general, the earth was covered with snow; the parts which were free from it, were full of black turfy hillocks. We saw about 20 or 30 cows, and the commander had six good horses. These, and their dogs, are their only tame animals: being obliged to keep a great number of the latter, they can rear only such cattle as are a match for them in strength and size. For, during the whole of the summer season, the dogs are turned loose, to provide entirely for themselves; and are sometimes so ravenous, that they will even venture to attack the bullocks.

In Bolcheretsk the buildings are all in the same style; they consist of logs of wood, and are thatched. The Major's house is considerably larger than the rest, and has three capacious rooms, neatly papered; but the tale, which covered the windows, gave them a disagreeable and mean appearance. The town consists of low buildings, in rows of five or six habitations each, connected together by a passage extending the whole length of them; having the kitchen and store-house on one side, and the dwelling apartments on the other. There are also barracks for the Russian soldiers and cosacks; a tolerable church; a court-room; and, at the end of the town, a number of Balagans. The number of the inhabitants is between five and six hundred. A handsome entertainment was given by the Major, in the evening, to which were invited all the respectable inhabitants of both sexes. The next day we made a private application to Fedositch, the merchant, in order to purchase some tobacco; the sailors having been without that favourite commodity for upwards of a year. This, however, like other similar transactions, came immediately to the knowledge of the commander; and, in a very short time after, we were surprized to find four bags of tobacco in our house, each containing upwards of 100 pounds; which the Major requested might be presented to our sailors, in his name, and that of the garrison under his command. By the same conveyance, we received 20 loaves of sugar, and as many pounds of tea, which they requested the officers to accept of; as they understood that we were almost destitute of those articles. A present was also sent by Madame Behm, for Captain Clerke, which consisted of honey, butter, figs, rice, and other articles; accompanied with her best wishes, that, in his infirm state, they might prove serviceable to him. We strenuously endeavoured to oppose this profusion of bounty, and were extremely anxious to restrain it; fully convinced that they were giving us almost the whole stock of their garrison. But the answer we received from the Major, on these occasions, generally was, That he had been in distress himself, and he was sensible that we must now be in that situation. The length of time, indeed, since we had touched at any known port, appeared to them almost incredible, and seemed to require the evidence of our maps, and other concurrent circumstances, to obtain their credit. Among the latter, we shall mention a curious fact, which Major Behm related to us this morning, and which he said he should not have known how to account for, but for our arrival. Among the people of the north of Asia, it is well known, that the Tschutki only have maintained their independence, and resisted all the efforts of the Russians to reduce them. The last attempt was in 1750, and, after variety of temporary advantages on each side, the Russian forces retreated, after having lost their commanding officer. The Russians afterwards removed their frontier fortress, from the Anadyr to the Ingiga, a river which runs into the northern extremity of the sea of Okotsk, and gives its name to a gulph, west of that of Pen-shink.

(C) A View in the Town of BOLCHERETZK the Capital of KAMTSCHATKA.

in 1813. Vol. 1. No. 1. 1813. at the House of the N. 1. 1813. at the House of the N. 1. 1813.

shinsk. On the day of our arrival at Bolcheretfk, the Major had received dispatches from this fort, acquainting him, that a party of the Tschutki had arrived there, with voluntary offers of friendship and a tribute. That, on asking the cause of so unexpected an alteration in their sentiments, they had acquainted his people, that two large Russian boats had visited them, towards the end of the preceding summer; that they had been shewn the greatest kindness by the people who were in them, and had entered into a league of amity with them; and that, in consequence of this, they came to the Russian fort, in order to settle a treaty upon terms agreeable to both nations. This remarkable tale had given rise to much speculation, both at Ingiginfk and Bolcheretfk; and must have remained utterly unintelligible, had it not been elucidated by us. It was no small satisfaction to us, to have thus shewn the Russians, even by accident, the best method of collecting tribute, and extending their dominions; in hopes that the good understanding, which this event has produced, may rescue a brave people from such powerful invaders.

This day being Friday, the 14th, we were engaged to dine with Captain Shmaleff, who, in order to vary our amusements, entertained us with an exhibition of dancing, in the Russian and Kamtschadale style. It is impossible to convey an adequate idea of this uncouth exhibition. The figure of the Russian dance, resembled those of our hornpipes, and consisted of one, two, or four performers at a time. Their steps were exceedingly short and quick, their feet being raised but a very little way from the ground; their arms were hung down close to the sides, the body being kept, the whole time, erect and immovable, except when the performers passed each other, when the hand was suddenly raised with an awkward motion. But, if the Russian dance was unmeaning and ridiculous, the Kamtschadale was infinitely more so. The principal aim, in their performances, is to represent the clumsy gestures of the bear, which the inhabitants of this country have frequent opportunities of observing in various situations. To describe the awkward postures, exhibited on these occasions, would appear tedious and uninteresting. In general, however, the body was bowed, and the knees bent, whilst the arms were employed in imitating the motions of that awkward animal. Much time had been spent in our journey to Bolcheretfk, and being informed that our return might, perhaps, be more difficult and tedious, we were obliged to acquaint the Major this evening, with our intention of departing the next day. We could not think of leaving our new acquaintance without regret: and were agreeably surprised, when the Major promised to accompany us, if we would stay but one day longer. He told us, that he had made up his dispatches, and resigned the command of Kamtschatka to Captain Shmaleff; having made the necessary preparations for his departure to Okotsk, which was shortly to take place; but that he should be happy in postponing his journey, and attending us to St. Peter and St. Paul's, in order to be satisfied, that nothing which could be done to serve us, should be omitted. For the articles which Mr. King had given to the Major's children, he received, the next morning, a most magnificent Kamtschadale dress, such as the principal Toions wear on the most solemn occasions. This habit, as we were informed by Fedositch, must have cost, at least, 120 roubles. He also, at the same time, was presented with a handsome sable muff, as a present from his daughter.

Saturday, the 15th, we dined with the commander, who, willing to give us an opportunity of seeing as much as we could of the manners and customs of the country, invited all the principal inhabitants of the town, to his house this evening. The dresses of the women were splendid, after the Kamtschadale manner. Captain Shmaleff's lady, and the wives of the other officers of the garrison, were dressed in a pretty taste, partly in the Siberian, and partly in the European mode. Madame Behm, in particular, appeared in a grand European dress. The richness and variety of

No. 75.

the silks worn by the women, as well as the singularity of their dress, was very striking: and the whole had the air of some enchanted scene, in the midst of the most desert and dreary country in the universe. The entertainments of this night were dancing and singing. As we had fixed upon the next morning for our departure, we retired early to our apartments, where three travelling dresses presented themselves to our view, made after the Kamtschadale mode, which had been provided for us by the commander. He came to us himself soon after, to see that proper care was taken in packing up our things. We had, indeed, no inconsiderable load of baggage; for, exclusive of his liberal presents, Captain Shmaleff, and several other individuals, shewed us many instances of kindness and generosity. On the 16th, early in the morning, we were preparing for our departure, when we were invited to take our leave of Madame Behm, in our passage to the boats. Already impressed with sentiments of the warmest gratitude, for the benevolent and generous treatment we had received at Bolcheretfk, they were much heightened by the affecting scene which followed. On quitting our apartments, we saw all the soldiers and cossacks of the garrison drawn up on one side; and, on the other, were all the male inhabitants of the town, in their best cloathing; the whole body of the people joining in a melancholy song, which, we were informed, it was usual to sing on the departure of friends. Thus we marched till we arrived at the commander's house, preceded by the drums and music belonging to the garrison. Here we were received by Madame Behm, accompanied by several ladies, habited in long silk cloaks, lined with furs of various colours; forming a most splendid appearance. Having partook of some refreshment which had been provided for us, we proceeded to the water-side, attended by the ladies, who joined with the rest of the people in the song; and, having taken leave of Madame Behm, after assuring her that the sense of the hospitality of Bolcheretfk, would be indelible in our hearts, we were too much affected not to hasten into the boats. At putting off, we received three cheers, which we immediately returned; and, on doubling a point, where we last beheld our friendly entertainers, they still added to our feelings, by a farewell cheer! On our return, the stream was so exceedingly rapid, that, notwithstanding the utmost exertions of our conductors, we did not arrive at the first village, Opatchin, till the 17th in the evening, which did not exceed the rate of 20 miles a day. On the 19th, we reached Natchekin, and crossed the plain to Karatchin on the 20th. The road was in much better order than when we passed it before, as it froze smartly in the night of the 19th. We proceeded down the Awatska river on Friday, the 21st, and passed over the shoals, at the entrance of the bay, before it was dark. During the whole of our journey, we were highly pleased with the willingness and alacrity, with which the Toions and their Kamtschadales assisted us at the different ostrogs. On seeing the Major, joy appeared in every countenance; and they were much affected upon being informed that he would shortly leave them. A messenger had been dispatched from Bolcheretfk to Captain Clerke, acquainting him with the nature of our reception; and that the Major intended to accompany us on our return; apprizing him, at the same time, of the day he might expect us. We observed, with pleasure, as we approached the harbour, all our boats coming towards us. The men were all clean, and the officers as well arrayed as their wardrobes would then permit them to be. The Major was struck at the healthy appearance of our sailors, and was surprised to see that many of them had no other covering than a shirt and trowsers, though it actually snowed at that very instant. Major Behm had expressed an inclination to visit the ships before he landed; but, being informed that Captain Clerke was extremely ill, he thought it would be improper to disturb him at so late an hour; it being then after nine o'clock. Mr. King therefore attended him to the serjeant's house, and afterwards went on board to communicate to Captain

7 R

Clerke

Clerke what had happened at Bolcheretsk. He was much concerned to find that, during his absence, that officer's health was considerably impaired, instead of growing better, as we flattered ourselves it might, from undisturbed repose in the harbour, and a milk and vegetable diet. The next morning, Mr. King conducted the Major to the ships; where he was received with every possible mark of distinction, and saluted with 13 guns. He was attended by the commander of a Russian galliot, two merchants from Bolcheretsk, a master of a sloop, and the priest of the village of Paratounca. Having visited the Captain, and taken a view of the two ships, he returned to dine on board the *Resolution*. In the course of the afternoon, the curiosities which we had collected were shewn him, and an assortment of each article presented to him by Captain Clerke. Here we cannot suppress an instance of great generosity and gratitude in our sailors; who, being informed of the handsome present which had been made them by the Major, voluntarily requested that their grog might be withheld, and their allowance of spirits presented to the garrison of Bolcheretsk; saying they knew brandy was extremely scarce in that country, the soldiers on shore having offered four roubles a bottle for it. We could not but admire this extraordinary sacrifice, knowing how much the sailors felt, when abridged or deprived of their grog. Indeed, they never had that article withheld from them but in warm weather, that they might enjoy a greater proportion when it was most necessary; but this generous proposal would deprive them of it, even in the inclement season we had naturally to expect in our northern expedition. The officers, however, would not permit them to suffer by their generosity, and substituted, in the room of the small quantity of brandy, which the Major consented to accept, an equal quantity of rum. A dozen or two of Cape wine for Madame Behm, and some other trifling presents which we were enabled to make, were accepted with great politeness. The tobacco was distributed the next morning, among the crews of both vessels; every man that chewed or smoked tobacco being allowed three pounds, and the others who did not, only one. We have already observed that the Major had resigned the command of Kamtschatka, and was speedily to repair to Petersburg; and he now expressed his willingness to convey any dispatches we might chuse to commit to his care. Such an opportunity was not to be neglected; and Captain Clerke requested him to take the charge of some papers relative to our voyage, to the British Ambassador at the Russian court. At first, we intended to transmit only a concise journal of our proceedings; but, after mature consideration, Captain Clerke was of opinion, that the whole account of our discoveries might safely be committed to the care of a man, who had given the strongest proofs of probity and virtue. Considering also, that a very hazardous part of the voyage was still to be performed, he resolved to send, by him, the whole of Captain Cook's journal; together with his own, from the death of that commander, till our arrival at Kamtschatka; and also a chart of our discoveries. Mr. Bayly and Mr. King also determined to send an account of our proceedings to the board of longitude. From these precautions, had any accident befallen us, the Admiralty would have become possessed of the principal facts of our voyage. It was farther resolved, that a smaller packet should be dispatched from Okotsk, which the Major supposed would reach Petersburg by December; and that he expected to arrive there himself in February or March. The Major was entertained alternately in the two ships, as well as we were able, the three following days. On Thursday, the 25th, he departed, and was saluted with 13 guns; the sailors, at their own request, expressing their regard for him by three cheers. Mr. King and Mr. Webber attended him, the next morning, some few miles up the Awatka river, where the Russian priest and his family were waiting to bid a last adieu to their commander. When taking our leave of the Major, it is difficult to say, whether the worthy priest and his family or ourselves were

most affected. Though our acquaintance had been of short duration, his behaviour had inspired us with the highest esteem for him; and we could not part (perhaps for ever) with one, to whom we were under such infinite obligations, without indulging the most tender feelings. Exclusive of the stores, which might probably be carried to a public account, the value of the private presents bestowed on us, must have amounted to upwards of 200 pounds. But, however extraordinary this generosity may appear, it was exceeded by his delicacy in conferring favours, and his ingenious endeavours to prevent our feeling the weight of obligations, which he knew we were unable to requite. In supporting a public character, and maintaining the honour of his sovereign, he is still more entitled to our admiration, as he was actuated by sentiments the most noble and enlarged. The service in which we were engaged, he told us, was for the general benefit of mankind; and entitled us to the offices of humanity, and the privileges of citizens, in whatever country we might be driven. That, by affording us such relief as was in his power, he was certain that he was acting agreeably to the wishes of his empress; and that he could not so entirely forget her character, or his own honour, as to barter for the performance of a duty. Among other things, he said, he made a particular point of setting a good example to the Kamtschadales, who were just emerging from a state of barbarism; that they considered the Russians as their patterns, in every respect; and that he hoped they would, in future, think it a duty incumbent on them to render strangers every assistance in their power, and believe it to be the universal practice of all polished and civilized nations. The Major having, so far as he was capable, relieved our present distresses, he was not unmindful of our future wants; and, imagining we should not be able to discover the passage we were in search of, and that we should return to Kamtschatka; he procured from Captain Clerke, the particulars of what flour and cordage he should want, promising to send them from Okotsk, to wait our arrival. He also presented the Captain with a written paper, enjoining every Russian subject to assist us to the utmost of their abilities. Having thus given a narrative of the journey of our party to, and their return from Bolcheretsk, their reception there, and the departure of Major Behm, we shall now recount the transactions which passed at Petropaulowka during our absence.

On Friday, the 7th of May, not long after we had quitted the bay of Awatka, a great piece of ice drove against the *Resolution*, and brought home the small bower anchor; in consequence of which the other anchor was weighed, and the ship was moored again. The carpenters, who were occupied in stopping the leak, were under the necessity of taking off great part of the sheathing from the bows; and many of the trunnels were found to be so loose and rotten, that they were drawn out easily with the fingers. On Tuesday the 11th, heavy gales blew from the N. E. which obliged both vessels to strike their yards and top-masts; but the weather becoming more moderate in the afternoon, and the ice having drifted away as far as the mouth of the harbour of Petropaulowka, they warped close to the shore for the greater convenience of procuring wood and water, and again moored, as before; the mouth of the bay shut in by the most southerly point of Rakowina harbour, bearing S. and the town N. half W. at the distance of half a mile. On the 12th, a party was detached to cut wood, but made little progress in that service, on account of the snow, which still covered the ground. A convenient spot, abreast of the ships, was cleared, where there was a good run of water; and a tent being pitched for the cooper, the empty casks were landed, and the sail-makers sent ashore. On Saturday, the 15th, as the beach was then clear of ice, a party was sent to haul the seine, and caught a plentiful supply of fine flat-fish for the companies of both ships. From this time, indeed, till we quitted the harbour, we were even overpowered with the great quantities of fish which came in from every quarter. The Toions, both

of this town, and of Paratounca, a neighbouring village, had received orders from Major Behm to employ, in our service, all the Kamtschadales; so that it frequently happened, that we could not take into the ships the presents which were sent us. They generally consisted of herrings, trout, flat fish, and cod. The former, which were in their highest perfection, and of a delicious flavour, were in extreme plenty in this bay. The people of the Discovery, at one time, surrounded such an amazing quantity in their seine, that they were obliged to throw out a very considerable number, lest the net should be broken to pieces; and the cargo they landed was still so abundant, that, besides having a sufficient stock for immediate use, they filled as many casks as they could conveniently spare for salting; and, after sending on board the Resolution a tolerable quantity for the same purpose, they left behind several bushels upon the beach.

The ice and snow now began rapidly to disappear, and plenty of nettle-tops, celery, and wild garlick, were gathered for the use of the crews; which being boiled with portable soup and wheat, furnished them with an excellent and salutary breakfast; and with this they were every morning supplied. The birch-trees were also tapped, and the sweet juice, of which they produced great quantities, was constantly mixed with the brandy allowed to the men. On the 16th, a small bullock was killed, which the serjeant had procured for the ships' companies. Its weight was 272 pounds. It was served out to both the crews for their Sunday's dinner, and was the first fresh beef which they had tasted since the departure of our vessels from the Cape of Good Hope, in December, 1776; a period of almost two years and a half. This evening John Macintosh, the carpenter's mate expired, after having been afflicted with a dysentery ever since we had left the Sandwich Isles. He was a peaceable and industrious man, and greatly regretted by his messmates. Though he was the fourth person that we had lost by sickness during our voyage, he was the first who, from his age and constitution, could be said to have had, on our setting out, an equal chance of life with the rest of his companions. Watman was supposed by us to be about 60 years old; and Roberts, and Mr. Anderson, from the decline which had manifestly commenced before our departure from England, most probably could not, under any circumstances, have lived to a later period than they did.

Captain Clerke's health continuing daily to decline, notwithstanding the salutary change of diet which Kamtschatka afforded him, the priest of Paratounca, as soon as he was informed of the weak state he was in, supplied him every day with milk, bread, fowls, and fresh butter, though his habitation was 16 miles from the harbour where our ships were stationed. On our arrival, the Russian hospital, near the town of St. Peter and St. Paul, was in a very deplorable state. All the soldiers were, in a greater or less degree, afflicted with the scurvy, many being in the last stage of that disorder. The rest of the Russian inhabitants were likewise in a similar condition; and we observed, that our friend the serjeant, by drinking too freely of the spirits he had received from us, had brought on himself, in the course of a few days, several of the most alarming symptoms of that disease. Captain Clerke, desirous of relieving them from this lamentable state, put them all under the care of our surgeons, and gave orders, that a supply of four krout, and malt, for wort, should be furnished for their use. A surprising alteration soon took place in the figures of most of them; and their speedy recovery was chiefly attributed to the effects of the sweet wort.

On Tuesday, the 1st of June, 250 poods, or 9,000 pounds weight of rye flour, were brought on board the Resolution; and the Discovery received a proportional quantity. We were supplied with this flour from the stores of Petropaulouska. The men were now put on their full allowance of bread, which, from the time of our leaving the Cape of Good Hope, they had not been indulged in. The same day, we completed our stock of water, 65 tons having been conveyed on board. Fri-

day, the 4th, we had fresh breezes, and heavy rains, so that we were disappointed in our design of dressing the ships, and obliged to content ourselves with firing 21 guns, in honour of His Majesty's birth-day, and celebrating it, in other respects, in the best manner we could. Port, who, on account of his skill in languages, was left with us, partook, as well as the serjeant, (in the capacity of commandant of the place) of the entertainment of the day. The worthy priest of Paratounca, having been informed that it was the anniversary of our sovereign's birth, gave likewise a sumptuous feast, at which several of our gentlemen were present, who were highly pleased with their entertainment; of which dancing formed a part. On the 6th, 20 head of cattle arrived, having been sent us; by the directions of the commander, from the Verchnei Ostrog, which stands on the river Kamtschatka, at the distance of almost a hundred miles from this place. These cattle were of a moderate size; and, though the Kamtschadales had been 17 days in driving them down to the harbour, were in good condition when they arrived. The four succeeding days were employed in making preparations for putting to sea; and on Friday, the 11th, about two o'clock in the morning, we began to unmoor. Before, however, we had got up one anchor, so violent a gale sprung up from the N. E. that we thought proper to moor again, supposing, from the position of the entrance of the Bay, that the current of wind would, in all probability, set up the channel. The pinnace was dispatched to examine the passage, and returned with intelligence, that the wind blew violently from the S. E. with a great swell, setting into the bay; so that any attempt to get out to sea would have been attended with considerable risque. Mr. Port now took his leave of us, carrying with him the box containing the journals of our voyage, which Major Behm was to take charge of, and the packet that was to be forwarded by express. On the 12th, the gale having abated, we began unmooring again; but, after having broken the messenger, and received a running purchase with a six inch hauler, which likewise broke three times, we were, at last, under the necessity of heaving a strain at low water, and waiting for the flowing of the tide to raise the anchor. This measure succeeded, though not without damaging the cable. About three o'clock in the afternoon, the best bower was weighed, and we set sail; but, at eight, the tide making against us, and the wind being inconsiderable, we anchored again in ten fathoms water, off the mouth of Rakowina harbour: the Ostrog being at the distance of between two and three miles, bearing N. by E. half E. the elevated rock on the western side of the passage, bearing S. and the needle rocks, on the eastern side of the passage, S. S. E. half E.

On Sunday, the 13th, at four o'clock, A. M. we got under way with the tide of ebb; and, as there was a perfect calm, the boats were dispatched a-head for the purpose of towing the ships. About 10, a south-easterly wind springing up, and the tide having turned, we were obliged to let go our anchors again, in seven fathoms; the Ostrog bearing N. half E. at the distance of a mile from the land that was nearest to us; and the three needle rocks being in the direction of S. half E. In the afternoon, Captain Gore and Lieutenant King landed on the east side of the passage, where they observed, in two different places, the remains of spacious villages; and, on the side of a hill, they saw an old ruined parapet, with four or five embrasures. It had guns mounted on it in Beering's time, as that navigator himself informs us; and commanded the passage up the mouth of the bay. Not far from this spot, were the ruins of some subterraneous caverns, which our two gentlemen conjectured to have been magazines. About six o'clock P. M. we weighed anchor, with the ebb tide; and turned to windward; but, two hours after, a thick fog coming on, we were under the necessity of bringing to, our soundings not affording us a sufficient direction for steering betwixt several sunken rocks, situated on each side of the passage we were to make. The next morning, the fog in some degree dispersing, we weighed as soon as the tide began to ebb; and, there being lit-

the wind, the boats were sent a-head to tow; but, about 10 o'clock, both the wind and tide set in so strong from the sea, that we were once more obliged to cast anchor, in 13 fathoms water, the high rock being at the distance of six furlongs, in the direction of W. one quarter S. We continued, during the remainder of the day, in this situation, the wind blowing fresh into the mouth of the bay. Towards the evening, the weather was extremely dark and cloudy with an unsettled wind.

On the 15th, we were surprized, before day-light, with a rumbling noise, that resembled distant thunder; and when the day appeared, we found that the sides and decks of our ships were covered, near an inch thick, with a fine dust like emery. The air was at the same time loaded and obscured with this substance; and, towards the volcano mountain, which stands to the northward of the harbour, it was exceedingly thick and black, insomuch that we were unable to distinguish the body of the hill. About 12 o'clock, and during the afternoon, the loudness of the explosions increased; and they were succeeded by showers of cinders, which, in general, were of the size of peas, though many of those that were picked up from the deck were larger than a hazel nut. Several small stones, which had undergone no alteration from the action of fire, fell with the cinders. In the evening we had dreadful claps of thunder, and vivid flashes of lightning, which, with the darkness of the sky, and the sulphureous smell of the air, produced a very awful and tremendous effect. Our distance from the foot of the mountain was, at this time, about eight leagues. On the 16th, at day-break, we got up our anchors, and stood out of the bay; but the wind falling, and the tide of ebb setting across the passage on the eastern shore, we were driven very near the three needle rocks, situated on that side of the entrance, and were under the necessity of hoisting out the boats, for the purpose of towing the ships clear of them. At 12 o'clock, we were at the distance of six miles from the land; and our depth of water was 43 fathoms, over a bottom of small stones, of the same kind with those which had fallen upon our decks, after the late eruption of the volcano. The country had now a very different appearance from what it had on our first arrival. The snow, except what remained on the summits of some very lofty mountains, had vanished; and the sides of the hills, which abounded with wood in many parts, were covered with a beautiful verdure. As our Commander intended to keep in sight of the coast of Kamtschatka, as much as the weather would allow, in order to ascertain its position, we continued to steer towards the N. N. E. with variable light winds, till Friday, the 18th. The volcano was still observed to throw up immense volumes of smoke; and we did not strike ground with 150 fathoms of line, at the distance of 12 miles from the shore. This day the wind blew fresh from the S. and the weather became so thick and hazy, that it was imprudent to make any further attempts at present to keep in sight of the land. However, that we might be ready, whenever the fog should clear up, to resume our survey, we ran on in the direction of the coast, (as represented in the Russian charts) and fired signal guns for the Discovery to proceed on the same course. At 11 o'clock, just before we lost sight of land, Cheepoonkoi Nofs, so denominated by the Russians, was at the distance of seven or eight leagues, bearing N. N. E. On the 20th, at three o'clock in the morning, the weather becoming clearer, we stood in towards the land; and, in the space of an hour afterwards, saw it a-head, extending from N. W. to N. N. E. at the distance of about five leagues. The northern part we conjectured to be Kronotskoi Nofs; its position in the Russian charts, nearly agreeing with our reckoning in respect to its latitude, which was 54 deg. 42 min. N. though, in point of longitude, we differed considerably from them; for they place it 1 deg. 48 min. E. of Awatska; whereas our computation makes it 3 deg. 34 min. E. of that place, or 162 deg. 17 min. E. of Greenwich. The land about this cape is very elevated, and the inland mountains were, at this time, covered with snow. There is no appearance of inlets or bays in the coast; and the

shore breaks off in steep cliffs. We had not long been gratified with this view of the land, when the wind freshened from the S. W. bringing on a thick fog, which obliged us to stand off in the direction of N. E. by E. The fog dispersing about noon, we again steered for the land, expecting to fall in with Kamtschatkoi Nofs, and gained a sight of it at day-break on the 21st. The S. W. wind being soon after succeeded by a light breeze that blew off the land, we were prevented from approaching the coast sufficiently near to determine its direction, or describe its aspect. At noon, our long. was 163 deg. 50 min. and our lat. 55 deg. 52 min. the extremes of the land bore N. W. by W. three quarters W. and N. by W. three quarters W. and the nearest part was at the distance of about 24 miles. At nine in the evening, when we had approached about 6 miles nearer the coast, it appeared to form a projecting peninsula, and to extend 11 or 12 leagues in the direction nearly of N. and S. It is level, and of a moderate elevation; the southern extreme terminates in a low sloping point; that to the northward forms a steep bluff head; and between them, 10 or 12 miles to the S. of the northern cape, there is a considerable break in the land. On both sides of this break, the land is low. A remarkable hill, resembling a saddle, rises beyond the opening; and a chain of lofty mountains, capped with snow, extends along the back of the whole peninsula. As the coast runs in an even direction, we were uncertain with respect to the position of Kamtschatkoi Nofs, which, according to Mr. Muller, forms a projecting point towards the middle of the peninsula; but we afterwards found, that, in a late Russian map, that appellation is given to the southern cape. The latitude of this, from several accurate observations, was 56 deg. 3 min. and its longitude, 163 deg. 20 min. To the S. of this peninsula, the great river Kamtschatka runs into the sea. The season being too far advanced for us to make an accurate survey of the coast of Kamtschatka, it was the design of Captain Clerke, on our course to Beering's Straights, to ascertain chiefly the respective situations of the projecting points of the coast. We therefore steered across a spacious bay, laid down between Kamtschatkoi Nofs and Olutorikoi Nofs, with a view of making the latter; which is represented by the Russian geographers, as terminating the peninsula of Kamtschatka, and as being the southern limit of the country of the Koriacs.

On Tuesday, the 22d, we passed a dead whale, which emitted a most horrible smell, perceivable at the distance of three or four miles. It was covered with a very considerable number of gulls, petrels, and other Oceanic birds, which were regaling themselves upon it. On the 24th, the wind, which had shifted about during the three preceding days, settled at S. W. bringing on clear weather, with which we proceeded towards the N. E. by N. across the bay, having no land in sight. In the course of this day we observed a great number of gulls, and were disgusted with the indelicate manner of feeding of the arctic gull, which has procured it the appellation of the parasite. This bird, which is rather larger than the common gull, pursues the latter species whenever it meets them; the gull, after flying about for some time, with loud screams, and manifest indications of extreme terror, drops its excrement, which its pursuer instantly darts at, and catches in its beak before it falls into the sea.

On Friday, the 25th, at one o'clock, P. M. when in the latitude of 59 deg. 12 min. and in the longitude of 168 deg. 35 min. a very thick fog came on, about the time we expected to obtain a view of Olutorikoi Nofs, which (if Muller's position of it, in the latitude of 59 deg. 30 min. and in the longitude of 167 deg. 36 min. is right) could then have been only 12 leagues from us; at which distance, we might easily have discerned land of a moderate height. Our depth of water, at present, was so great, that we had no ground with 160 fathoms of line. The fog still continuing, prevented us from making a nearer approach to the land, and we steered E. by N. at five o'clock, which is a little more easterly than the Russian charts represent the trending of the coast

coast from Olutorfkoi Nofs. The next day, a fresh gale blew from the S. W. which lasted till noon on the 27th, when the weather clearing up, we steered to the N. with an intention of making the land. Our latitude, at this time, was 59 deg. 49 min. and our longitude 175 deg. 43 min. Though we saw some shags in the morning, which are imagined never to fly far from the land, yet there was no appearance of it during the whole day. However, the next morning, about six o'clock, we had sight of it towards the N. W. The coast appeared in hills of a moderate elevation; but inland, others were observed considerably higher. The snow lying in patches, and no wood being perceived, the land had a very barren aspect. At nine o'clock, we were ten or eleven miles from the shore, the southern extreme bearing W. by S. about six leagues distant, beyond which the coast seemed to incline to the W. This point being in the longitude of 174 deg. 48 min. and in the latitude of 61 deg. 48 min. is situated according to the Russian charts, near the mouth of the river Opuka. The northern extremity, at the same time, bore N. by W. between which, and a hill bearing N. W. by W. quarter W. the coast appeared to bend towards the W. and form a deep bay. At the distance of about eight miles from the land we observed a strong rippling; and being under apprehensions of meeting with foul ground, we made sail to the N. E. along the coast. On heaving the lead, we found the depth of water to be 24 fathoms, over a bottom of gravel. We therefore concluded, that the appearance above-mentioned, was occasioned by a tide, then running to the southward. At noon, the extremes of the land bearing W. S. W. and N. N. E. we were abreast

of the low land, which, we now observed, joined the two points, where we had before expected to discover a deep bay. The coast bends a little towards the W. and has a small inlet, which is, perhaps, the mouth of some inconsiderable river. Our longitude was now 175 deg. 43 min. and our latitude 61 deg. 56 min. During the afternoon, we continued our course along the coast, which exhibited an appearance of sterility, and the hills rose to a considerable elevation inland, but the clouds on their tops prevented us from determining their height. About eight o'clock in the evening, some of our people thought they saw land to the E. by N. upon which we stood to the southward of E. but it proved to be nothing more than a fog bank. At midnight, the extreme point bearing N. E. quarter E. we conjectured that it was St. Thadeus's Nofs; to the S. of which the land inclines towards the W. forming a deep bight, wherein the river Katirka, according to the charts published by the Russians, is situate. On Tuesday the 29th, the weather was unsettled, with the wind at the N. E. point. On the 30th, at noon, we observed in longitude 180 deg. and latitude 61 deg. 48 min. At this time, St. Thadeus's Nofs bore N. N. W. at the distance of 23 leagues; and beyond it we perceived the coast extending almost directly N. The easternmost point of the Nofs is in the latitude of 62 deg. 50 min. and in the longitude of 179 deg. The land about it, from its being discerned at so great a distance, may justly be supposed to be of a considerable height. During this and the preceding day, we saw numbers of sea-horses, whales, and seals; also albatrosses, gulls, sea-parrots, guillemots, and other birds.

C H A P. XVIII.

The Resolution and Discovery continue their course to the north—Tschukotskoi Nofs descried—Isle of St. Lawrence—Sight of the two coasts of Asia and America at the same instant—Obstructions from the ice—Fruitless attempts to discover a passage on the American side—The plan of Captain Clerke, with respect to our future designs—Attempt, in vain, to pass the ice to the north-west—Critical situation of the Discovery—The damages sustained, after having again been obstructed by the ice—Captain Clerke resolves, to the great joy of the ship's crew, to return to the southward—Pass Serdze Kamen—Proceed through Beering's Straits—Remarks on the extent of the north-east coast of Asia—Reasons for rejecting Muller's map—Impracticability of a north-east, or north-west passage from the Atlantic into the Pacific Ocean—The progress made in 1778, compared with that made in 1779—Observations on the Sea, Sea-Coasts, &c. North of Beering's Straits.

ON Thursday, the 1st of July 1779, at noon, Mr. Bligh, master of the Resolution, found by experiment, that the ship made a course to the N. E. at the rate of about half a mile in an hour: this he attributed to the effect of a southerly swell, rather than to that of any current. The wind towards the evening, freshening from the S. E. we steered to the N. E. by E. for the point that Beering calls Tschukotskoi Nofs, which we had observed on the 4th of September the preceding year, at the same time that we perceived, towards the S. E. the Isle of St. Lawrence. This cape, and St. Thadeus's Nofs, from the north-eastern and south-western extremes of the extensive Gulph of Anadir, into the bottom of which the river of that name discharges itself, separating, as it passes, the country of the Tschutski from that of the Koriacs. On the 3d, at noon, we observed in latitude 63 deg. 33 min. longitude 186 deg. 45 min. Between twelve and one, we descried the Tschukotskoi Nofs, bearing N. half W. at the distance of 13 or 14 leagues. At five in the afternoon, we saw the island of St. Lawrence, in the direction of E. three-quarters N. and also another island, which we imagined was between St. Lawrence and Anderson's Island, about 18 miles E. S. E. of the former. As we had no certain knowledge of this island, Captain Clerke was inclined to have a nearer view of it, and immediately hauled the wind towards it: but it unfortunately happened, that we were unable to weather the Isle of St. Lawrence, and were therefore obliged to bear up again, and pass them all to the leeward. The latitude of the Island of St. Lawrence, according to the most accurate observations, is 63 deg. 47 min. and its

longitude is 188 deg. 15 min. This island, if its boundaries were at present within our view, is about three leagues in circumference. The northern part of it may be discerned at the distance of ten or a dozen leagues. As it has some low land to the S. E. the extent of which we could not perceive, some of us supposed, that it might perhaps be joined to the land to the eastward of it: we were, however, prevented by the haziness of the weather, from ascertaining this circumstance. These islands, as well as the land adjoining to the Tschukotskoi Nofs, were covered with snow, and presented a most dismal aspect. About midnight, the Isle of St. Lawrence was five or six miles distant, bearing S. S. E. and our soundings were 18 fathoms. We were accompanied with sea fowl of various sorts, and observed some guillemots and small crested hawks. The weather continuing to thicken, we lost sight of land till Monday the 5th, when we had a view of it both to the N. E. and N. W. Our longitude, at this time, was 189 deg. 14 min. and our latitude 65 deg. 24 min. As the islands of St. Diomedé, which are situated in Beering's Strait, between the two continents of Asia and America, were determined by us the preceding year to be in the latitude of 65 deg. 48 min. we were at a loss how to reconcile the land towards the N. E. with the position of those islands. We therefore stood for the land till three o'clock in the afternoon, when we were within the distance of four miles from it, and discovering it to be two islands, were pretty well convinced of their being the same; but the haziness of the weather still continuing, we, in order to be certain, with respect to our situation, stood over to the

Asiatic coast, till about seven o'clock in the evening; at which time we had approached within two or three leagues of the eastern cape of that continent. The Cape is an elevated round head of land, and extends about five miles from N. to S. It forms a peninsula, which is connected with the continent by a narrow isthmus of low land. It has a bold shore; and three lofty, detached, spiral rocks, are seen off its N. part. It was at present covered with snow, and the beach encompassed with ice. We were now convinced of our having been under the influence of a strong current setting to the northward, which had occasioned an error of twenty miles in our computation of the latitude at noon. At the time of our passing this Strait the last year, we had experienced a similar effect. Having now ascertained our position, we steered N. by E. At ten o'clock in the evening, the weather clearing up, we saw, at the same instant, the remarkable peaked hill near Cape Prince of Wales, on the North American coast, and the East Cape of Asia, with the two islands of St. Diomed between them. In the course of this day, we saw several large white gulls, and great numbers of very small birds of the hawk kind. The beak of the latter was compressed, and large in proportion to the body of the bird: the colour was dark brown, or rather black, the breast whitish, and towards the abdomen a reddish brown hue was visible. On the 6th, at twelve o'clock, our latitude was 67 deg. and our longitude 191 deg. 6 min. Having already passed many large masses of ice, and observed that it adhered, in several places, to the shore of the Asiatic continent, we were not greatly surprised when we fell in, about three o'clock, with an extensive body of it, stretching towards the W. This appearance considerably discouraged our hopes of proceeding much further to the N. this year, than we had done the preceding. There being little wind in the afternoon, the boats were hoisted out in pursuit of the sea-horses, great numbers of which were seen on the detached pieces of ice; but they returned without success: these animals being extremely shy, and, before our people could come within gun-shot of them, always retreated into the water. At seven o'clock P. M. having hoisted in the boats, we stood on to the north-eastward, with a fresh southerly breeze, intending to explore the American continent, between the latitudes of 68 deg. and 69 deg. which, on account of the foggy weather, we had not an opportunity of examining the last year. In this attempt we were partly disappointed again: for, on the 7th, about six o'clock in the morning, we were stopped by a large body of ice, stretching from N. W. to S. E. but, not long afterwards, the horizon becoming clear, we had a view of the American coast, at the distance of about ten leagues, extending from N. E. by E. to E. and lying between 68 deg. and 68 deg. 20 min. of northern latitude. The ice not being high, we were enabled by the clearness of the weather to see over a great extent of it. The whole exhibited a compact solid surface, not in the least thawed; and seemed also to adhere to the land. Soon after, the weather becoming hazy, we lost sight of the land; and it being impossible to approach nearer to it, we steered to the N. N. W. keeping the ice close on board; and having, by noon, got round its western extremity, we found that it trended nearly N. Our longitude, at this time, was 192 deg. 34 min. and our latitude 68 deg. 22 min. We proceeded along the edge of the ice, to the N. N. E. during the remainder of the day, passing through many loose pieces which had been separated from the main body, and against which our vessels were driven with great violence, notwithstanding our utmost caution. About eight in the evening, we passed some drift-wood: at midnight the wind veered to the N. W. and there were continued showers of snow and sleet. The thermometer had now fallen from 38 deg. to 31 deg. On Thursday, the 8th, at five o'clock, the wind shifting more to the northward, we could continue to longer on the same tack, by reason of the ice, but were under the necessity of standing towards the W. Our depth of water, at this time, was 19 fathoms; from which, upon comparing

it with our remarks on the soundings in the preceding year, we inferred, that our present distance from the coast of America did not exceed six or seven leagues; but our view was circumscribed within a much narrower compass, by a heavy fall of snow. Our latitude, at noon, was 69 deg. 21 min. and our longitude 192 deg. 42 min. At two o'clock P. M. the weather became clearer, and we found ourselves close to an expanse of ice, which, from the mast-head, was discovered to consist of very large compact bodies; united towards the exterior edge, but, in the interior parts, some pieces were observed floating in vacant spaces of the water: it extended from W. S. W. to N. E. by N. We bore away towards the S. along the edge of it, endeavouring to get into clearer water; for the strong northerly winds had drifted down such numbers of loose pieces, that we had been encompassed with them for some time, and were unable to prevent the ships from striking against several of them. On the 9th, a fresh gale blew from the N. N. W. accompanied with violent showers of snow and sleet. We steered W. S. W. and kept as near the main body of ice as we could; but had the misfortune to damage the cut-water against the drift pieces, and rub off some of the sheathing from the bows. The shocks, indeed, which our ships received, were frequently very severe, and were attended with considerable hazard. Our latitude, at noon, was 69 deg. 12 min. and our longitude 188 deg. 5 min.

We had now sailed almost 40 leagues to the W. along the edge of the ice, without perceiving any opening, or a clear sea beyond it towards the N. no prospect therefore remained of making further progress to the northward at present. For this reason Captain Clerke determined to bear away to S. by E. the only quarter which was clear, and to wait till the season was somewhat more advanced, before he made any further attempts to penetrate through the ice. He proposed to employ the intermediate time in surveying the bay of St. Lawrence, and the coast situate to the S. of it; as it would be a great satisfaction to have a harbour so near, in case of future damage from the quantity of ice in these parts. We were also desirous of paying another visit to the Tschutski; and more particularly since the accounts we had heard of them from Major Behm. In consequence of this determination, we made sail to the southward, till the 10th at noon, when we passed considerable quantities of drift ice, and a perfect calm ensued. The latitude, at this time, was 68 deg. 1 min. and the longitude 188 deg. 30 min. This morning we saw several whales; and in the afternoon, there being great numbers of sea-horses on the pieces of ice that surrounded us, we hoisted out the boats, and dispatched them in pursuit of those animals. Our people had more success on this occasion, than they had on the 6th; for they returned with three large ones, and a young one, besides having killed or wounded some others. They were witnesses of several striking instances of parental affection in these animals. All of them, on the approach of the boats towards the ice, took their young ones under their fins, and attempted to escape with them into the sea. Some, whose cubs were killed or wounded, and left floating upon the surface of the water, rose again, and carried them down, sometimes just as our men were on the point of taking them into the boat; and could be traced bearing them to a considerable distance through the water, which was stained with their blood. They were afterwards observed bringing them, at intervals, above the surface, as if for air, and again plunging under it, with a horrid bellowing. The female, in particular, whose young one had been killed, and taken into the boat, became so furious, that she even struck her two tulks through the bottom of the cutter. About eight o'clock in the evening, an easterly breeze sprung up, with which we continued to steer to the southward; and, at midnight, fell in with many extensive bodies of ice. We attempted to push through them under an easy sail, that the ships might sustain no damage; and when we had proceeded a little further towards the S. nothing was visible but a very large and compact mass of ice, extending

tending to the N. E. S. W. and S. E. as far as the eye could reach. This formidable obstacle prevented our visiting the Tschutski; for no space remained open, except back again to the northward. We therefore tacked, at three o'clock in the morning of the 11th, and stood to that quarter. The lat. at noon, was 67 deg. 49 min. and the long. 188 deg. 47 min. On Monday, the 12th, we had light winds and hazy weather. On examining the current, we found it set towards the N. W. at the rate of half a mile an hour. We continued our northerly course, with a breeze from the S. and fair weather, till 10 o'clock in the morning of the 13th, when we again found ourselves close in with a solid mass of ice, to which we could perceive no limits from the mast-head. This was an effectual discouragement to all our hopes of penetrating further; which had been greatly raised, by our having now advanced almost 10 leagues, through a space, which, on the 9th, had been found to be occupied by impenetrable ice. Our situation, at this time, was nearly in the middle of the channel, betwixt the two continents; our lat. was 69 deg. 37 min. and the main body of the ice extended from W. S. W. to E. N. E.

In that part of the sea where we now were, there was no probability of getting further to the north. Captain Clerke therefore determined to make a final attempt on the coast of America, for Bassin's Bay, since we had found it practicable to advance the furthest on this side, in the preceding year. We accordingly, during the remainder of the day, worked to the windward, with a fresh breeze from the east. We observed several fulmars, and arctic gulls, and passed two trees, both of which seemed to have lain a long time in the water. The larger one was, in length, ten or eleven feet, and in circumference, about three, without either the bark or branches. We continued our course to the eastward on the 14th, with thick foggy weather. The next day, the wind blowing fresh from the west, and having, in some measure, dispersed the fog, we immediately steered to the north, in order to have a nearer view of the ice; and we were soon close in with it. It extended from N. N. W. to N. E. and was solid and compact: the exterior parts were ragged, and of various heights; the inner surface was even; and, as we supposed, from 8 to 10 feet above the level of the sea. The weather becoming moderate during the rest of the day, we shaped our course according to the trending of the ice, which, in several places, formed deep bays. On Friday, the 16th, the wind freshened, in the morning, and was accompanied with frequent and thick showers of snow. At eight o'clock in the forenoon, we had a strong gale from the W. S. W. which brought us under double-reefed top-sails; when, the weather in some degree clearing up, we found ourselves, as it were embayed; the ice having suddenly taken a turn to the south eastward, and encompassing us in one compact body, on all sides but the south. In consequence of this, we hauled our wind to the southward, being, at that time, in 26 fathoms water, and in the lat. of 70 deg. 8 min. N. and, as we imagined, at the distance of about 25 leagues from the American coast. At four in the afternoon, the gale increasing, we got the top-gallant-yards down upon the deck, furlled the mizen top-sail, and close-reefed the fore and main-top-sails. About eight o'clock, finding that our soundings had decreased to 22 fathoms, which we considered as an indication of our near approach to the coast of America, we tacked and steered to the northward. In the night we had boisterous weather, attended with snow: but the next morning it was clear and moderate; and, at eight o'clock, we got the top-gallant-yards across, and bore away, with the wind still at W. S. W. Our lat. at noon, was 69 deg. 55 min. and our long. 194 deg. 30 min. The wind slackened in the evening, and, about midnight, we had a calm. A light breeze arising from the E. N. E. at five in the morning of the 18th, we continued our progress towards the N. with a view of regaining the ice as soon as possible. We saw numbers of sea-parrots, and small ice-birds, and also many whales; and passed several logs of drift-wood. The lat. at 12 o'clock, was 70 deg. 26 min. and the

long. 194 deg. 54 min. Our soundings, at the same time, were 23 fathoms; and the ice extended from N. to E. N. E. being about one league distant. At one o'clock in the afternoon, observing that we were close in with a firm united mass of ice, stretching from E. to W. N. W. we tacked, and, the wind veering to the westward, stood to the E. along the edge of it, till 11 in the evening. A very thick fog then coming on, and the depth of water decreasing to 19 fathoms, we hauled our wind to the southward. About nine o'clock in the evening, a white bear swam close by the Discovery; it afterwards went towards the ice, on which were likewise two others. The weather clearing up, at one in the morning of Monday, the 19th, we bore away to the N. E. till two o'clock, when we were again so completely embayed by the ice, that no opening remained, except to the southward; to which quarter we therefore directed our course, and returned through a very smooth water, with favourable weather, by the same way we had come in. We were unable to penetrate further towards the N. than at this time, when our lat. was 70 deg. 33 min. which was about five leagues short of the point to which we had advanced the preceding summer. We stood to the S. S. W. with light winds from the N. W. near the edge of the main body of ice, which was situated on our left-hand, extending between us and the American coast. At noon, our lat. was 70 deg. 11 min. and our long. 196 deg. 15 min. and our soundings were 16 fathoms. We supposed, from this circumstance, that the Icy Cape was at the distance of only seven or eight leagues from us: but, though the weather was in general pretty clear, there was, at the same time, a haziness in the horizon; so that we could not expect to have an opportunity of seeing the cape. During the afternoon, two white bears appearing in the water, some of our people immediately pursued them in the jolly-boat, and were so fortunate as to kill them both. The larger one, which was, in all probability, the dam of the younger, being shot first, the other would not leave it, though it might have escaped with ease on the ice, while the men were re-loading their muskets; but continued swimming about, till after having been several times fired upon, it was shot dead. The length of the larger one, from the snout to the end of the tail, was seven feet two inches; its circumference, near the fore legs, was four feet ten inches; the height of the shoulder was four feet three inches; and the breadth of the fore-paw was ten inches. The weight of its four quarters was 436 pounds. The four quarters of the smallest weighed 256 pounds. These animals furnished us with some good meals of fresh meat. Their flesh, indeed, had a strong fishy taste, but was infinitely superior to that of the sea-horse; which, however, our people were again persuaded, with no great difficulty, to prefer to their salted provisions.

On Tuesday, the 20th, at six o'clock, A. M. a thick fog arising, we lost sight of the ice for the space of two hours; but, when the weather became clearer, we again had a view of the main body to the S. S. E. and immediately hauled our wind, which was easterly, towards it, expecting to make the American coast to the S. E. which we effected between 10 and 11 o'clock. The lat. at noon, was 69 deg. 33 min. and the long. 194 deg. 53 min. Our depth of water, at the same time, was 19 fathoms. The land was at the distance of eight or ten leagues, extending from S. by E. to S. S. W. half W. being the same we had seen the preceding year; but it was, at present, much more covered with snow than at that time; and the ice seemed to adhere to the shore. We continued to sail in the afternoon, through a sea of loose ice, and to steer towards the land, as near as the wind, which blew from E. S. E. would permit. A thick fog came on at eight o'clock in the evening, and the wind abated. Observing a rippling in the water, we tried the current, and found it set to the E. N. E. at the rate of a mile an hour: we therefore resolved to steer before the wind, during the night, in order to stem it, and oppose the large pieces of loose ice, which were setting us on towards the coast. Our soundings, at midnight, were twenty fathoms. The next morning, at eight o'clock, the wind freshening, and the fog dispersing, we again

again had sight of the coast of America to the south-eastward, at the distance of nine or ten leagues, and hauled in for it; but the ice in a short time effectually stopped our further progress on that side, and we were obliged to bear away towards the W. along the edge of it. Our lat. at 12, was 69 deg. 34 min. our long. was 193 deg. and our soundings were 24 fathoms. A connected solid field of ice, thus baffling all our efforts to make a nearer approach to the land, and (as we had some reason to imagine) adhering to it, we relinquished all hopes of a N. E. passage to Great-Britain. Our Commander now finding it impossible to advance further to the northward on the American coast, and deeming it equally improbable, that such a prodigious quantity of ice should be dissolved by the few remaining weeks that would terminate the summer, considered it as the best step that could be taken, to trace the sea over to the coast of Asia, and endeavour to find some opening that would admit him further N. or see what more could be done upon that coast, where he hoped to meet with better success. In consequence of this determination, we steered W. N. W. during the afternoon of the 21st of July, through a great quantity of loose ice. About ten o'clock in the evening, discovering the main body of ice through the fog, right a-head, and very near us, and being unwilling to stand to the southward, so long as we could possibly avoid it; we hauled our wind, which was easterly, and made sail to the N. but in the space of an hour afterwards, finding that the weather became clearer, and that we were surrounded by a compact field of ice on all sides, except to the S. S. W. we tacked, and steered in that direction, for the purpose of getting clear of it. On the 22d, at noon, our lat. was 69 deg. 30 min. and our long. 187 deg. 30 min. In the afternoon, we again came up with the ice, which extending to the N. W. and S. W. obliged us to proceed to the southward, in order to weather it. It may not here be improper to remark, that, since the 8th of July, we had twice traversed this sea, in lines almost parallel with the run we had just now made; that we were unable in the first of those traverses, to penetrate so far N. by eight or ten leagues, as in the second; and that in the last we had again met with a connected mass of ice, generally about five leagues to the southward of its position in the preceding run. This makes it evident, that the large compact fields of ice, observed by us, were moveable, or diminishing; but, at the same time, it does not authorise any expectation of advancing much farther, even in the most favourable seasons. About seven o'clock in the evening, the weather being hazy, and no ice visible, we made sail to the westward; but, between eight and nine, the haze dispersing, we found ourselves in the midst of loose ice, and very near the main body; we therefore stood upon a wind, which was still easterly, and continued to beat to windward during the night, hoping to weather the loose pieces, which the wind drove down upon us in such quantities, that we were in great danger of being blocked up by them. On Friday, the 23d, the clear water, in which we steered to and fro, did not exceed a mile and a half, and was lessening every moment. At length, after exerting our most strenuous endeavours to clear the loose ice, we were under the necessity of forcing a passage to the S. which we accomplished between seven and eight, though not without subjecting the ship to some very severe shocks. The Discovery was not so successful; for, about 11 o'clock, when she had almost got clear out, she became so entangled by several large pieces, that her progress was stopped, and she immediately dropped to leeward, and fell, broadside foremost, on the edge of a considerable body of ice; and there being an open sea to windward, the surf occasioned her to strike with violence upon it. This mass, at length, either so far broke, or moved, as to give the crew an opportunity of making another effort to escape; but, it unfortunately happened, that, before the ship gathered way enough to be under command, she fell to leeward a second time, on another fragment, and the swell rendering it unsafe to lie to windward, and finding no prospect of getting clear, they pushed into a small opening, furled their sails, and made the vessel fast with ice-

hooks. We beheld them in this dangerous situation at noon, at the distance of about three miles from us, in a N. W. direction; a fresh gale from the S. E. driving more ice towards the N. W. and augmenting the body that lay between us. Our lat. at this time, was 69 deg. 8 min. our long. 187 deg. and our soundings were 28 fathoms. To add to the apprehensions which began to force themselves on our minds, between four and five in the afternoon, the weather becoming thick and hazy, we lost sight of the Discovery. However, that we might be in a situation to afford her every possible assistance, we stood on close by the edge of the ice. About six o'clock the wind shifting to the north, gave us some hopes, that the ice might drift away, and release her from her danger; and in that case, as it was uncertain in what condition she might come out, we continued, every half hour, to fire a gun, with a view of preventing a separation. Our fears for her safety did not cease till nine, when we heard her guns fired in answer to ours; and not long afterwards being hailed by her, we were informed, that upon the change of wind, the ice began to separate, and that her people, setting all the sails, forced a passage through it.

On Saturday, the 24th, we steered to the S. E. till 11 o'clock A. M. when our course was again obstructed by a large body of loose ice, to which we could discover no bounds. At noon we found ourselves in lat. 68 deg. 53 min. long. 188 deg. About four in the afternoon, we had a calm, and the boats were hoisted out in pursuit of the sea-horses, which appeared in prodigious numbers. Ten of them were killed by our people, as many as could be made use of by us for eating, or for converting into lamp-oil. We held on our course with a south-westerly wind, along the edge of the ice, till four in the morning of the 25th, when perceiving a clear sea beyond it, to the south-eastward, we steered to that point. During the remaining part of the day, we continued to run towards the S. E. with no ice in sight. At noon we observed in lat. 68 deg. 38 min. long. 189 deg. 9 min. and our soundings were 30 fathoms. For the remainder of the day, and till noon of the 27th, we stood backwards and forwards, to clear ourselves of different pieces of ice. At two in the afternoon, we had sight of the continent to the S. by E. and, at four, having run, since noon, to the S. W. we were encompassed by loose masses of ice, with the main body in view, stretching in the direction of N. by W. and S. by E. as far as the eye could reach, beyond which we descried the Asiatic coast, bearing S. and S. by E. It being now necessary to come to some determination respecting the course we were next to steer, Captain Clerke dispatched a boat, with the carpenters, on board the Discovery, to make enquiries into the particulars of the damages she had lately received. In the evening they returned, with the report of Captain Gore, and of the carpenters of both vessels, that the damages sustained were such as would require three weeks to repair; and that it would be requisite, for that purpose, to make the best of their way to some port. Thus finding our farther progress to the N. as well as our nearer approach to either continent, obstructed by immense bodies of ice, we considered it as not only injurious to the service, by endangering the safety of the ships, but likewise fruitless, with respect to the design of our voyage, to make any farther attempts for the discovery of a passage. This, therefore, added to Captain Gore's representations, determined Captain Clerke to lose no more time after what he concluded to be an unattainable object, but to proceed to the bay of Awatska, to repair our damages there, and before the winter should set in, to take a survey of the coast of Japan. It is impossible to describe the joy that sparkled in the countenance of every individual, when the Captain's resolution was made known. All were completely weary of a navigation full of danger, and in which the greatest perseverance had not been rewarded with the smallest prospect of success. We therefore turned our thoughts towards home, after an absence of three years, with a delight and satisfaction, as fully enjoyed, as if we had been already in sight of the Land's-end. On Wednesday, the 28th, we worked to windward, with a fresh breeze from the S. E. being still in

in sight of the coast of Asia. At four in the morning, Cape Serdze Kamen bore S. S. W. distant 7 leagues. On the 29th, the wind continuing unfavourable, we made but slow progress to the southward. We had no land in view till seven in the evening of the 30th, when the fog dispersing, we saw Cape Prince of Wales bearing S. by E. distant six leagues; and the island of St. Diomedé S. W. by W. We now stood to the W. and at eight made the East Cape, which at midnight, was four leagues distant, bearing W. by N. On Saturday, the 31st, at four o'clock A. M. the East Cape bore N. N. E. and the N. E. part of the Bay of St. Lawrence, W. by S. distant 12 miles. At noon, we observed in latitude 65 deg. 6 min. longitude 189 deg.

We had now passed Beering's Straits, and taken a final leave of the N. E. coast of Asia; and here we shall state our reasons for adopting two general conclusions relative to its extent, in opposition to the sentiments of Mr. Muller. The first is, that the promontory, called East Cape, is actually the most easterly point of that quarter of the globe; or in other words, that no part of that continent extends in longitude beyond 190 deg. 22 min. E. The second is, that the latitude of the north-easternmost extreme is somewhat to the southward of 70 deg. N. With regard to the former, if such land really exists, it must certainly be to the N. of the 69th deg. of latitude, where the discoveries made in our present voyage terminate.

We propose therefore in the first place to investigate the probable direction of the coast beyond this point. Now, Russia being the only nation, that has hitherto navigated this part of the ocean, all our information respecting the position of the coast to the northward of Cape North, is derived from the journals and charts of the persons who have been engaged, at different times, in determining the bounds of that extensive empire, and these are, in general, so confined, contradictory, and imperfect, that we cannot easily form a distinct idea of their pretended, much less collect the particulars, of their real discoveries. On this account, the extent and figure of the peninsula, inhabited by the Tschutski still remains a point, on which the Russian Geographers are divided greatly in their opinions. Mr. Muller, in the map which he published in 1754, supposes that this country extends towards the N. E. as far as the latitude of 75 deg. and to the longitude of 190 deg. E. of Greenwich; and that it ends in a round cape, which he denominates Tschukotskoi Nofs. To the S. of this cape, the coast, as he imagines, forms a bay to the W. bounded in the latitude of 67 deg. 18 min. by Serdze Kamen, the most northerly point observed by Beering in his expedition in 1728. The map published in 1776 by the academy of St. Petersburg, gives a new form to the whole peninsula, placing its north-easternmost extreme in the latitude of 73 deg. longitude 178 deg. 30 min. and the most easterly point in latitude 65 deg. 30 min. longitude 189 deg. 30 min. All the other maps we have seen, both manuscript and printed, vary between these two, apparently more according to the fancy and conjectures of the compiler, than on any grounds of more accurate intelligence. The only particular in which there is a general coincidence, with very little variation, is the position of the East Cape, in the latitude of 66 deg. The form of the coast both to the N. and S. of the East Cape, in the map of the academy, is extremely erroneous, and may be entirely disregarded. In Mr. Muller's map, the coast towards the N. has some degree of resemblance to our survey, as far as the latter extends, except that he does not make it trend sufficiently to the W. but makes it recede only about 5 deg. of longitude, between the latitude of 66 and 69 deg. whereas it actually recedes near ten. Between the latitude of 69 and 74 deg. the coast, according to him, bends round to the N. and N. E. and forms a large promontory. On what authority he grounds this representation of the coast, comes next under our consideration.

Mr. Coxe, whose accurate researches into this subject, give great weight to his sentiments, is of opinion, that the extremity of the Nofs in question, was never

passed except by Deshneff and his party, who failed in the year 1648, from the river Kovyma, and are imagined to have got round it into the Anadyr. As the narrative of this expedition, the substance of which has been given by Mr. Coxe, in his account of Russian discoveries, comprehends no geographical delineation of the coast along which they failed, our conjectures respecting its position must be derived from incidental circumstances; and from these it evidently appears, that the Tschukotskoi Nofs of Deshneff, is, in reality, the promontory named by Captain Cook, the East Cape. Speaking of the Nofs, he says, that a person may sail from the isthmus to the Anadyr, with a favourable wind, in three days and three nights. This perfectly agrees with the situation of the East Cape, which is about 120 leagues from the mouth of the river Anadyr; and there being no other isthmus to the N. between that and the latitude of 69 deg. it seems evident, that, by this description, he certainly means either the Cape in question, or some other situated to the S. of it. He says, in another place, that, opposite to the isthmus, there are two islands in the sea, upon which we observed some of the Tschutski nation, in whose lips pieces of the teeth of the sea-horse were fixed. This description coincides exactly with the two islands that lie to the S. E. of the East Cape. We observed, indeed, no inhabitants upon them; but it is by no means improbable, that a party of Americans from the opposite continent, whom this description suits, might have been accidentally there at that time, and he might easily mistake them for a tribe of the Tschutski. These two circumstances seem to us to be conclusive on the point of the Tschukotskoi Nofs, though there are others of a more dubious nature from the same authority, and which now remain to be investigated. Deshneff, in another account, says, that in going from the Kovyma to the Anadyr, a great promontory which projects very far into the sea, must be doubled; and that this cape extends between N. and N. E. It was, perhaps, from these expressions, that Muller was induced to represent the country of the Tschutski, in the form we find in his map; but, if he had been acquainted with the position of the East Cape, as determined by Captain Cook, and the striking agreement between that and the promontory or isthmus, (for it must be remarked, that Deshneff still appears to be speaking of the same thing) in the circumstances above-mentioned, we are confident that he would not have thought those expressions of sufficient weight to authorise his extending the north eastern extreme of Asia, either so far to the N. or E. For these words of Deshneff may be reconciled with the opinion we have adopted, if we suppose that navigator to have taken these bearings from the small bight lying to the W. of the cape. The next authority, on which Muller has proceeded, seems to have been the deposition of the Cossack Popoff, taken at the Anadirkoi ostrog, in 1711. This Cossack was sent by land, in company with several others, to demand tribute from the independent Tschutski tribes, who inhabited the parts about the Nofs. The first circumstance, in the narrative of this journey, that can tend to lead to the situation of Tschukotskoi Nofs, is its distance from Anadirk; and this is represented as a journey of ten weeks, with loaded rein-deer; for which reason, it is added, their day's journey was very inconsiderable. We cannot, indeed, conclude much from so vague an account, but as the distance between the East Cape and the Ostrog, exceeds 200 leagues in a direct line, and consequently may be supposed to allow 12 or 14 miles a day, its situation is not incompatible with Popoff's calculation. Another circumstance stated in this deposition is, that their route lay at the foot of a rock, named Matkol, situate at the bottom of a spacious gulph. This gulph Muller conjectures to be the bay he had laid down between the latitudes of 66 deg. and 72 deg. and he accordingly places the rock Matkol in the center of it; but it appears to be more probable, that it might be a part of the Gulph of Anadyr, which they would doubtless touch upon in their journey from the Ostrog to the East Cape. What seems, however, to

put this point beyond all dispute, and to prove that the Cape which Popoff visited cannot be to the northward of the latitude of 69 deg. is that part of his deposition which relates to an island lying off the Nofs, from whence the opposite continent might be discerned. For, as the two continents, in latitude 69 deg. diverge so far as to be upwards of 100 leagues distant, it is certainly very improbable, that the coast of Asia should again trend in such a manner to the E. as to come almost within sight of the American coast. If these arguments are allowed to be conclusive against the form and extent of the peninsula of the Tschutski, it must be evident that the East Cape is the Tschukotskoi of the earlier Russian navigators: we say earlier, because Beering, and, after him, the late Russian geographers, have affixed this appellation to the S. E. cape of the peninsula of the Tschutski, which was formerly distinguished by the name of the Anadirsckoi Nofs: and, consequently, hence it will follow, that the undescribed coast, extending from the latitude of 69 deg. to the mouth of the Kovyma, must trend more or less towards the W. As an additional proof of this, we may observe, that the Tschutskoi Nofs is constantly laid down as dividing the sea of Kovyma from that of Anadyr, which we think could not possibly be, if any large cape had projected to the N. E. in the more advanced latitudes.

Another question arising on this point is, to what degree of northern latitude this coast extends, before it inclines more immediately to the W. If the position of the mouth of the Kovyma, both with regard to its latitude and longitude, were ascertained accurately, it might perhaps be easy to form a plausible conjecture on this head. Captain Cook was always strongly induced to believe, that the northern coast of Asia, from the Indigirka eastward, has hitherto been usually laid down above two degrees to the northward of its true situation: and he has therefore, on the authority of a map that was in his possession, and on the intelligence which he received at Oonalaschka, placed the mouth of the Kovyma, in his chart of the N. E. coast of Asia, and the N. W. coast of America, in the latitude of 68 deg. Should the Captain be right in this conjecture, it is probable, for the reasons we have already stated, that the coast of Asia does not, in any part, exceed 70 deg. before it trends towards the W. and consequently, that we were within one degree of its north-eastern extremity. For if the continent be imagined to extend any where to the north of Shelatckoi Nofs, it can scarcely be supposed that such an interesting circumstance would have been omitted by the Russian navigators, who mention no remarkable promontory between the Anadyr and the Kovyma, except the East Cape. Another particular, which Dezhneff relates, may, perhaps, be deemed a farther confirmation of this opinion, namely, that he met with no obstruction from ice in sailing round the north-eastern extremity of Asia; though he adds, that this sea is not, at all times, so free from it; as indeed appears evidently from his not succeeding in his first expedition, and, since that, from the failure of Shalauoff, as well as from the interruptions and impediments we met with, in two successive years, in our present voyage. That part of the continent between Cape North, and the mouth of the Kovyma, is 125 leagues in longitudinal extent. About a third of this distance from the Kovyma, eastward, was explored in 1723, by Fedot Amosskoff, a Sinbojarsckoi of Jakuts, who informed Mr. Muller, that its direction was easterly. Since that time, it has been surveyed, with some degree of accuracy, by Shalauoff, whose chart makes it trend to the N. E. by E. as far as Shelatckoi Nofs, which he places at the distance of about 43 leagues to the E. of the Kovyma. The space, therefore, between this Nofs and Cape North, upwards of 80 leagues, is the only part of the Russian dominions now remaining unexplored. If the Kovyma, however, be erroneously laid down, in point of longitude as well as latitude (a supposition by no means improbable) the extent of the unexplored coast will diminish in

proportion. The reasons which incline us to imagine, that in the Russian charts, the mouth of the river is placed considerably too far to the W. are the following. First, because the accounts that have been given of the navigation of the Frozen Ocean, from that river, round the north-eastern extreme of Asia, to the gulf of Anadyr, do not agree with the supposed distance between those places. Secondly, because the distance from the Anadyr to the Kovyma, over land, is represented by former Russian travellers as a journey of no very great length, and easily performed. Thirdly, because the coast from the Shelatckoi Nofs of Shalauoff appears to trend directly S. E. towards the Cape. If this be really the case, it may be inferred, that, as we were, in all probability, not more than one degree to the southward of Shelatckoi Nofs, only 60 miles of the coast of Asia are unascertained.

We are of opinion, thinking it highly probable, that a N. W. passage from the Atlantic into the Pacific Ocean, does not exist to the southward of the 56th deg. of latitude. If therefore a passage really exists, it must certainly be either through Baffin's bay, or by the N. of Greenland, in the western hemisphere; or in the eastern, through the Frozen Sea, to the N. of Siberia; and on which ever side it is situated, the navigator must pass through the straits distinguished by the name of Beering's Straits. The impracticability of penetrating into the Atlantic Ocean, on either side, through these Straits, is therefore, all that now remains to be offered to the reader's consideration. Here we must previously observe, that the sea to the northward of Beering's Straits, was found by us to be more free from ice in August than in July, and perhaps in some part of September it may be still more clear of it. But, after the autumnal equinox, the length of the days diminishes so fast, that no farther thaw can be expected; and we cannot reasonably attribute so great an effect to the warm weather in the first fortnight of the month of September, as to imagine it capable of dispersing the ice from the most northern parts of the coast of America. Admitting this, however, to be possible, it must at least be allowed, that it would be highly absurd to attempt to avoid the icy cape, by running to the known parts of Baffin's Bay, (a distance of 420 leagues, or 1260 miles) in so short a space of time as that passage can be supposed to remain open. On the side of Asia there appears still less probability of success, not only from what came to our knowledge, relative to the state of the sea to the southward of Cape North, but likewise from what we have gathered from the experience of the lieutenants under the direction of Beering, and the journal of Shalauoff, respecting that on the N. of Siberia. But, the possibility of sailing round the north-eastern extremity of Asia, is undoubtedly proved by the voyage of Dezhneff, if its truth be admitted; yet when we reflect, that since the time of that navigator, near a century and a half has elapsed, during which, in an age of curiosity and enterprize, no person has yet been able to follow him, we can entertain no very great expectations of the public benefits to be derived from it. But even on the supposition, that, in some remarkably favourable season, a vessel might find a clear passage round the coast of Siberia, and arrive safely at the mouth of the Lena, still there remains the Cape of Taimura, extending to the 78th deg. of latitude, which no navigator has hitherto had the good fortune to double. Some, however, contend, that there are strong reasons for believing, that the nearer approach we make to the pole, the sea is more clear of ice, and that what masses we observed in the lower latitudes, had originally been formed in the great rivers of Siberia and America, by the breaking up of which the intermediate sea had been filled. But even if that supposition be true, it is no less certain, that there can be no access to those open seas, unless this prodigious mass of ice should be so far dissolved in the summer, as to admit of a ship's making her way through it. If this be a real fact, we made choice of an improper time of the year for attempting to discover this passage,

which should have been explored in the months of April and May, before the rivers were broken up. But several reasons may be alledged against such a supposition. Our experience at Petropaulowska, gave us an opportunity of judging what might be expected farther northward; and upon that ground, we had some reason to entertain a doubt, whether the two continents might not, during the winter, be even joined by the ice; and this coincided with the accounts we received in Kamtschatka, that, on the coast of Siberia, the inhabitants, in winter, go out from the shore upon the ice, to distances that exceed the breadth of the sea, in some parts, from one continent to the other. The following remarkable particular is mentioned in the deposition above referred to. Speaking of the land seen from the Tchutski Nofs, it is said, that, during the summer, they sail in one day to the land in baidares, a kind of vessel formed of whale-bone, and covered with the skins of seals; and, in the winter, as they go swift with rein-deer, the journey may be performed in a day. Muller's account of one of the expeditions, undertaken for the purpose of discovering a supposed island in the Frozen Sea, is still more remarkable. His narrative is to the following purport. In 1714 a new expedition was prepared from Jakutsk, under the conduct of Alexei Markoff, who was to set sail from the mouth of the Jana; and if the Schitiki were not well adapted for sea voyages, he was to build, at a convenient place, proper vessels for prosecuting the discoveries without any great risque. Upon his arrival at Ust-janskoe Simovie, the port where he was to embark, he dispatched an account, dated the 2nd of February 1715, to the Chancery of Jakutsk, intimating, that it was impracticable to navigate the sea, as it was constantly frozen both in winter and summer; and that, consequently, the expedition could only be prosecuted in sledges drawn by dogs. He accordingly set out in this manner, accompanied with nine persons the 10th of March, in the same year, and returned to Ust-janskoe Simovie on the 3d of the succeeding month. The account of his journey is as follows: that for the space of seven days, he travelled with as much expedition as his dogs could draw, (which in good tracks, and favourable weather, is from 80 to 100 wersts a day) to the northward, upon the ice, without observing any island: that he was prevented from proceeding farther by the ice, which rose like mountains in that part of the sea: that he had ascended some of these, whence he could see to a great distance around him, but could discern no land: and that, at length, provisions for his dogs being deficient, many of them died, which reduced him to the necessity of returning.

Besides the above-mentioned arguments, which proceed upon an admission of the hypothesis, that the ice in this ocean comes from the rivers, others may be adduced, which afford good reason for suspecting the truth of the hypothesis itself. Captain Cook, whose opinion, with regard to the formation of ice, had originally coincided with that of the theorists we are now endeavouring to confute, found sufficient grounds, in the present voyage, for changing his sentiments. We observed, that the coasts of both continents were low; that the depth of water gradually decreased towards them, and that a striking resemblance prevailed between the two; from which circumstances, as well as from the description given by Mr. Hearne of the coppermine river, we have room for conjecturing, that, whatever rivers may discharge themselves into the Frozen Ocean, from the continent of America, are of a similar nature with those on the Asiatic side; which are said to be so shallow at their entrance, as to admit only vessels of inconsiderable magnitude; whereas the ice seen by us, rises above the level of the sea, to a height that equals the depth of those rivers; so that its entire altitude must be, at least, ten times greater. Another circumstance will naturally offer itself in this place to our consideration, which seems to be very incompatible with the opinion of those who suppose that land is necessary for the formation of ice, we mean the different state of the sea about Spitsbergen, and of that

which is to the northward of Beering's Straits. It is incumbent on those objectors to explain how it happens, that in the former quarter, and in the neighbourhood of much known land, navigators annually penetrate to near 80 deg. of northern latitude; whereas, on the other side, no voyager has been able to proceed with his utmost efforts beyond the 71st deg. where, moreover, the continents diverge nearly in the direction of E. and W. and where there is not any land known to exist in the vicinity of the pole. For the farther satisfaction of our readers on this subject, we refer them to Dr. Forster's "Observations round the world," where they will find the question of the formation of the ice, discussed in a full and satisfactory manner, and the probability of open polar seas disproved by many forcible arguments.

In order to give these observations their full force, we beg leave to subjoin a comparative view of the progress made by us to the northward, at the two different seasons in which we were occupied in that pursuit; together with some general remarks respecting the sea, and the coasts of the two continents, which lie to the N. of Beering's Straits. In 1778, we did not discover the ice, till we advanced to the latitude of 70 deg. on the 17th of August; and then we found it in compact bodies, which extended as far as the eye could discern, and of which the whole, or a part, was in motion, since, by its drifting down upon our ships, we were almost hemmed in between that and the land. After we had experienced, both how fruitless and dangerous it would be to attempt to penetrate farther to the northward between the land and the ice, we stood over towards the side of Asia, between the latitudes of 69 deg. and 70 deg. After having encountered in this track very large fields of ice, and though the fogs and thickness of the weather prevented us from entirely tracing a connected line of it across, yet we were certain of meeting with it before it reached the latitude of 70 deg. whenever we made any attempts to stand to the N. On the 26th of August, we were in latitude 69 deg. 45 min. longitude 184 deg. obstructed by it in such a manner, and in such quantities, that we could not pass either to the N. or W. and were under the necessity of running along the edge of it to the S. S. W. till we perceived land, which proved to be the Asiatic coast. With the season thus far advanced, the weather setting in with snow and sleet, and other indications of the approach of winter, we relinquished our enterprize for that time.

When we made a second attempt, the following season, in 1779, we did little more than confirm the remarks made by us in the first; for we never had an opportunity of approaching the continent of Asia in a higher latitude than 67 deg. nor that of America in any parts, except a few leagues between the latitude of 68 deg. and 68 deg. 20 min. that we had not seen the preceding year. We now met with obstructions from the ice 3 deg. lower; and our efforts to make farther progress to the northward, were chiefly confined to the middle space between the two coasts. We penetrated near 3 deg. farther on the side of America, than that of Asia, coming up with the ice both years sooner, and in more considerable quantities, on the latter coast. As we advanced in our northerly course, we found the ice more solid and compact: however, as in our different traverses from one side to the other, we passed over spaces which had before been covered with it, we imagined, that the greatest part of what we saw was moveable. Its height, on a medium, we estimated at eight or ten feet, and that of the highest at 16 or 18 feet. We again examined the currents twice, and found that they were unequal, though they never exceeded one mile an hour. We likewise found the currents to set different ways, but more from the S. W. than from any other quarter; yet whatever their direction might be, their effect was so inconsiderable, that no conclusions, with respect to the existence of any passage towards the N. could possibly be drawn from them. We found July much colder than August. The Thermometer, in the 1st of these months, was once at 28 deg. and frequently

quently at 30 deg. whereas, during the last season, in 1778, it was very uncommon in August, to have it so low as the freezing point. In both seasons, we experienced some high winds, all of which blew from the S. W. Whenever the wind was moderate from any quarter, we were subject to fogs; but they were observed to attend southerly winds more constantly than others. The straits, between the American and Asiatic continents, at their nearest approach, in lat. 66 deg. were ascertained by us to be 13 leagues, or 39 miles, beyond which they diverge to N. E. by E. and W. N. W. and in the lat. of 69 deg. their distance from each other is about 300 miles, or 100 leagues. In the aspect of the two countries to the N. of the straits, a great resemblance is discernible. Both of them are destitute of wood. The shores are low, with mountains farther inland, rising to a great height. The soundings, in the midway of the straits, were 29 and 30 fathoms, gradually decreasing as we approached either continent; with

this difference, however, that the water was somewhat shallower on the coast of America, than on that of Asia, at an equal distance from land. The bottom, towards the middle, was a soft slimy mud; and near either shore, it was a brownish sand, intermixed with a few shells, and small fragments of stones. We found but little tide or current, and that came from the W. But on the 30th of July, in the present year 1779, when in Beering's Straits, and steering to the southward, we found a current so strong as to make our passage both difficult and dangerous. It set at this time to the N. W. We might to these observations, which, we doubt not, will be highly acceptable to our very numerous friends and subscribers, add some others; but we apprehend, they will think, with us, that it is now time to resume the narrative of our voyage, which was broken off on the 31st of July, on which day, at noon, we had proceeded 18 leagues to the southward of the East Cape.

ON Sunday, the 1st of August, 1779, we observed in lat. 64 deg. 23 min. long. 189 deg. 15 min. at which time the Asiatic coast extended from N. W. by W. to W. half S. distant 12 leagues, and the land to the E. of St. Lawrence bore S. half W. On the 2d, the weather being clear, we saw the same land again, at noon, extending from W. S. W. half W. to S. E. and forming several elevated hummocks, which had the appearance of separate islands. Our lat. this day, at noon, we found to be 64 deg. 3 min. long. 189 deg. 28 min. and our soundings were 17 fathoms. We were not near enough to this land to ascertain, whether it was a group of islands, or only a single one. We had passed its most westerly point in the evening of the 3d of July, which we then supposed to be the Isle of St. Lawrence; the easternmost we sailed close by in September, the preceding year, and this we denominated Clerke's Island, and found it composed of a number of lofty cliffs, connected by very low land. Though those cliffs were mistaken by us, last year, for separate islands, till we made a very near approach to the shore, we are still inclined to conjecture, that the Isle of St. Lawrence is distinct from Clerke's Island, as there appeared between them a considerable space, where we did not observe the least appearance of rising ground. In the afternoon, we likewise saw what had the appearance of a small island, to the N. E. of the land that we had seen at noon, and which, from the thickness of the weather, we had only sight of once. We supposed its distance to be 19 leagues from the island of St. Lawrence, in the direction of N. E. by E. half E. On the 3d, we had light variable winds, and steered round the N. W. point of the Isle of St. Lawrence. In the afternoon, a fresh breeze rising from the E. we steered to the S. S. W. and quickly lost sight of St. Lawrence. On Saturday, the 7th, at noon, we observed in lat. 59 deg. 38 min. long. 183 deg. At four o'clock, having a dead calm, part of the companies of both ships were employed in fishing, and caught a number of fine large cod, in 17 fathoms water, which were distributed equally among the crews. To this place we gave the name of the Bank of Good Providence, and as soon as the breeze sprung up, we made sail, and stood to S. W. but we were forced more to the eastward than we wished, it being our in-

tention to make Beering's Island. On Tuesday, the 10th, we were, by observation, in lat. 56 deg. 37 min. Friday, the 13th, we dispatched a boat to the Discovery, for the purpose of comparing time, and she carried the disagreeable intelligence, that Captain Clerke had been given over by the surgeon. The weather falling calm, we hove to, in order to get some fish for the sick: a few were caught, and distributed accordingly.

On Tuesday, the 17th, at five o'clock, A. M. the man at the mast-head called out, Land to the N. W. This we imagined to be the island of Mednoi, which, in the Russian charts, is placed to the S. E. of Beering's Island. It is elevated land, and was at this time apparently free from snow. By our reckoning, it lies in lat. 54 deg. 28 min. long. 167 deg. 52 min. Captain Clerke, now perceiving his end drawing near, signified his desire, that the officers would receive their orders from Mr. King; and directed, for the last time, that we should repair, with all convenient speed, to the Bay of Awatska. The wind continuing westerly, we held on a southerly course, till Thursday, the 19th, when, after a few hours continuance of rain, early in the morning, it blew from the E. and became a strong gale. We made the most of it, by standing towards the W. with all the sail we could carry. On the 20th, the wind varying to the S. W. we steered a W. N. W. course. At noon, we observed in lat. 53 deg. 7 min. long. 162 deg. 49 min. On Saturday, the 21st, between five and six o'clock, A. M. we descried a very lofty peaked mountain, on the coast of Kamtschatka, known by the name of Chepoonskoi mountain, bearing N. W. by N. and distant near 30 leagues. At noon, the coast was observed to extend from N. by E. to W. with a very great haziness upon it, and distant about 12 leagues.

On Sunday the 22nd, at nine o'clock, A. M. a boat was sent off to the Discovery, to announce to Captain Gore, the death of our Commodore, Captain Charles Clerke, who paid the debt of nature when in the 38th year of his age. His death was occasioned by a consumption, which had manifestly commenced before his departure from England, and of which he had lingered during the whole continuance of the voyage.

His

His very gradual decay had for a long time rendered him a melancholy object to his friends; but the firmness and equanimity with which he bore the slow approaches of death, the constant flow of good spirits which he retained even to the last hour, and a cheerful resignation to the decree of heaven, furnished them with some consolation. It was impossible not to feel an uncommon degree of compassion for a gentleman, who had experienced a series of those difficulties and hardships, which must be the inevitable lot of every seaman, and under which he at last sunk. He was bred to the navy from his youth, and had been in many engagements during the war which commenced in 1756. In the action between the *Bellona* and *Courageux*, he was stationed in the mizen-top, and was carried overboard with the mast; but was taken up, without having received the least injury. He was midshipman on board the *Dolphin*, commanded by Commodore Byron, when she first sailed round the world; and was afterwards on the American station. In the year 1768, he engaged in a second voyage round the world, in the situation of master's mate of the *Endeavour*; and, during that expedition, succeeded to a lieutenancy. In the *Resolution* he made a third voyage round the world, in the capacity of second lieutenant: and, in a short time after his return, he was appointed master and commander. In the present expedition, he was appointed Captain of the *Discovery*, and to accompany Captain Cook. By the calamitous death of the latter, he succeeded of course, as we have already related, to the chief command. It would favour of injustice and ingratitude, not to mention, that, during the short time he was Commodore, we always observed him to be remarkably zealous for the success of the expedition. When the principal command devolved upon him, his health began rapidly to decline; and he was unequal, in every respect, to encounter the severity of a high northern climate. The vigour of his mind, however, was not, in the least, impaired by the decay of his body: and though he was perfectly sensible, that his delaying to return to a warmer region, was depriving himself of the only chance of recovery; yet, so attentive was he to his duty, that he was determined not to suffer his own situation to bias his judgment to the prejudice of the service: he therefore persevered in the search of a passage, till every officer in both ships, declared they were of opinion it was impracticable, and that any farther attempts would be equally hazardous and ineffectual.

The messenger who was sent to the *Discovery* with the melancholy news of our Commodore's death, brought a letter from Captain Gore, containing an order for Captain King to exert his utmost endeavours to keep in company with the *Discovery*, and, if a separation should happen, to repair as soon as possible, to St. Peter and St. Paul. At noon, we were by observation in lat. 53 deg. 8 min. long. 160 deg. 40 min. E. Cheepooniskoi Nofs bearing W. On the 23rd, we steered for the entrance of Awatka Bay, which we saw in the evening, at the distance of 5 leagues. At eight o'clock, the light-house, which now furnished a good light, bore W. N. by W. 3 miles distant. It was now a perfect calm, but, the tide being favourable, our boats were sent a-head, which towed us beyond the narrow parts of the mouth of the harbour. On the 24th, at one o'clock A. M. we dropped anchor, the ebb tide setting against us. At nine, we weighed, and before three P. M. we anchored in the harbour of St. Peter and St. Paul; having up our ensign half staff, as the body of our late Captain was in the vessel; and the *Discovery* followed us in a very short time. Both ships were moored in four fathoms water, muddy bottom. From the time we had set sail out of this bay, till the present time of our return, we had been in no harbour to refit, and had been driven from island to island, and from one continent to the other, till our ships had in a manner lost their sheathing, and were otherwise in a miserable condition; we therefore thought ourselves exceeding happy in arriving at port. Soon after we had anchored, we were visited by our old friend the Serjeant, still the com-

manding officer, who brought with him a present of berries, intended for our late Commodore. He was much affected at hearing of his death, and seeing the coffin that contained his remains. As the deceased had particularly requested to be buried on shore, and gave the preference to the church at Paratounca, we consulted the Serjeant about the necessary steps to be taken on this occasion, who referred us to the priest, as being the person best qualified to give us information on this subject. At the same time he signified his intention of sending an express to the Commander of Bolcheretsk, with an account of our arrival; when Commodore Gore begged to avail himself of that opportunity of conveying a letter to him, wherein he requested that 16 head of black cattle might be sent with all possible dispatch. At this time, we received intelligence of Soposnicoff's arrival from Oonalashka, who took charge of the packet sent by Captain Cook to the Admiralty, and which we had the pleasure to find, had been forwarded.

Wednesday, the 25th, in the morning, Captain Gore, in consequence of the death of our late Commodore, made out the new commissions. He himself succeeded to the chief command in the *Resolution*; and our lieutenant, Mr. King, was appointed Captain of the *Discovery*. Mr. Lanyan, master's mate of the *Resolution*, and who had been in that capacity, in a former voyage, on board the *Adventure*, was appointed to the vacant lieutenancy. In consequence of these arrangements, the following promotions took place. Lieutenants Burney and Rickman (from the *Discovery*) were appointed first and second lieutenants of the *Resolution*; and lieutenant Williamson first lieutenant of the *Discovery*. Captain King, by the permission of the Commodore, took in four midshipmen, who had rendered themselves useful to him in astronomical calculations; and whose assistance was become the more necessary, as we had not an ephemeris for the present year. And that astronomical observations might not be neglected to be made in either ship, Mr. Bayly took Captain King's place in the *Resolution*, for these purposes. This day we were attended by the Pope Romanoff Verethagen, the worthy priest of Paratounca. His expressions of sorrow for the death of Captain Clerke did honour to his feelings; but the good old gentleman, though much concerned, started several difficulties, and appeared rather unwilling to comply with the request of the deceased. He urged, among other objections, that the Church was soon to be pulled down; that every winter it was three feet deep in water; and that in a few years no vestige of it would remain, as the new church was to be erected near the Ostrog of Awatka, upon a drier and more convenient spot. He therefore advised, that the remains of our late Commodore should be deposited at the foot of a tree, the site of which was to be included in the body of the new church, where the bones of the Captain might probably rest for ages undisturbed: however, he submitted the choice of either place entirely to Captain Gore. These reasons, whether real or fictitious, the officers who had charge of the funeral could not disprove, and therefore some of our people had orders to dig the grave where the priest should direct.

The *Discovery* having suffered great injury from the ice, especially on the 23d of July, and continued exceeding leaky ever since, it was apprehended that some of her timbers might have started: our carpenters were therefore sent to assist those of the *Discovery* in repairing her. To accommodate those who were to be employed on shore, a tent was erected, and a party was sent into the country, north of the harbour, to fell timber. The observatories were placed at the west end of the village, near which was erected a tent, as an abode for the Commodore and Captain King. When the carpenters began to rip the damaged sheathing from the larboard bow, it was discovered, that three feet of the third strake were staved, and the timbers started: and as they proceeded, the decayed state of the ship's hull became more and more apparent. The season being now far advanced, Captain King was unwilling that

any hindrance or delay should happen through him, to Captain Gore's farther views of discovery, and therefore ordered the carpenters to rip off no more of the sheathing, than should be absolutely necessary for repairing the damages occasioned by the ice. He was apprehensive of their meeting with more decayed planks, which he thought had better remain in that state, than have their places supplied with green birch, even supposing it could be procured. All hands were now fully employed in their separate departments, that we might be perfectly ready for sea, by the time the carpenters had completed their business. Four men were set apart to haul the seine for salmon, which were caught in immense quantities, and we found them of most excellent quality. After the wants of both ships were sufficiently supplied, we daily salted down almost a hoghead. We had four invalids, who were employed in gathering greens, and cooking for those who were ashore. We also landed our powder, in order to have it dried; and the blubber of the sea horses, with which both ships had completely furnished themselves, in our passage to the north, was now boiled down for oil, and was become a very necessary article, having long since expended all our candles. The cooper was also employed in his department. Both ships companies were thus engaged till Saturday, the 28th, in the afternoon, which was allowed to every man (except the carpenters) to wash their linen, and get their clothes in tolerable order, that on Sunday they might make a decent appearance.

On Sunday, the 29th, we performed the last affecting offices at the interment of Captain Clerke, our late much respected Commodore; and to make the funeral the more solemn, every officer was desired to appear in his uniform; the marines were ordered to be drawn up under arms; and the common men to be dressed as nearly alike as possible, in order to attend the corpse from the water-side to the grave. All the Russians in the garrison assembled on the occasion, assisting respectfully in the solemnity, and the worthy pastor of Paratounca joined in the procession, walking with the gentleman who read the service. The ships, at the same time fired minute guns, and the drums, muffled as usual, beat the dead march. When the corpse arrived at the grave, it was deposited under a triple discharge of three volleys, fired by the marines, which concluded the burial service. When the grave was covered, it was thought proper to fence it in by piles driven deep in the ground, and afterwards to fill up the space inclosed with stones and earth, to preserve the body from being devoured in the winter by bears, or other wild beasts, who are remarkable for their sagacity in scenting out the bodies of dead passengers, when any happen to perish, and are buried near the roads. This mournful ceremony being over, an escutcheon was prepared, and neatly painted by the ingenious Mr. Webber, with the Captain's coat of arms properly emblazoned, and placed in the church of Paratounca. Underneath the escutcheon was the following inscription.

near the Ostrog of St. Peter and St. Paul,
The Body of
CHARLES CLERKE, Esquire,
Commander of his Britannic Majesty's
Ships, the Resolution and Discovery;
To which he succeeded on the Death of
JAMES COOK, Esquire,
Who was killed by the natives of an Island we
discovered in the South Sea, after having ex-
plored the Coast of America, from 42 deg.
27 min. to 70 deg. 40 min. 57 sec. N.
in search of a N. W. passage
from EUROPE to the
EAST-INDIES.

The Second Attempt being made by
Captain Clerke, who failed within some few
Leagues of Captain Cook; but was brought
up by a solid body of Ice, which he found
from the America to the Asia shore,

and almost trended due East and
West—He died at Sea,
on his return to the
Southward, on the
22nd Day of
August, 1779,
Aged 38 Years.

Another inscription was affixed to the tree under which he was interred. This tree stands on a little eminence, in the valley, north of the harbour, (and at some distance from the town), where the store-houses and hospital are situated, and round which several Russian gentlemen had been buried; but none so high upon the eminence as the spot pointed out for the grave of Captain Clerke, and which Captain Gore supposed to be such a situation, as was most consonant to the wishes of the deceased. The inscription at this place was nearly the same as that in the Church, and is as follows:

Beneath this tree lies the Body of
Captain CHARLES CLERKE, Esquire,
Commander of His Britannic Majesty's
Ships, the Resolution and Discovery:
Which Command he succeeded to, on the 14th
of February, 1779, on the Death of
Captain JAMES COOK,
Who was killed by the Natives of some
Islands he discovered in the South
Sea, on the Date above.
CAPTAIN CLERKE Died at Sea,
of a lingering Illness, on the 22nd Day of
August, 1779,
In the 38th Year of his Age:
And was Interred on Sunday, the 29th following.

On this occasion the crews of both ships were suffered to continue on shore, and to divert themselves, each as he liked best. It was Captain Clerke's desire that they should have double allowance for three days successively, and all that while to be excused from every other duty, than what the ordinary attendance in the ships required; but the season being far advanced, and a long track of unknown sea to traverse before they could reach China, the officers representing the hardships and inconveniences that so much lost time might bring upon themselves, they very readily gave up that part of the Captain's request, and returned to their respective duties early the next day. Accordingly, on Monday the 30th, the several parties reassumed their allotted employments; and on the 2nd of September, the carpenters proceeded to rip off such of the sheathing as had been injured by the ice, from the starboard-side; having first shifted the damaged planks, and repaired and caulked the sheathing of the larboard-bow. Four feet of the plank were discovered in the third strake under the wale, so much shaken as to require to be replaced; which was accordingly done; and on the 3d the sheathing was repaired. In the afternoon we got some ballast on board; after which we unhung the rudder, and caused it to be conveyed on shore, the lead of the pintles being much worn, and a considerable part of the sheathing rubbed off. This day an ensign arrived from Bolcheretsk, with a letter from the Commander of that place to Captain Gore; from which, by the assistance of the serjeant, we understood, that proper orders had been given respecting the cattle; and that in a few days we might expect to see them: to which was added, that Captain Shmaleff, who succeeded Major Behm, in his command, would pay us a visit on the arrival of a sloop which he expected from Okotk. The bearer of the letter was a son of Captain Lieutenant Synd, who about eleven years ago, was appointed to the command of an expedition on discovery, between Asia and America, and now resided at Okotk. He told us he was appointed to receive our directions, and to supply us with every thing that our service might require: that he should remain with us, till it was convenient for the Commander to leave Bolcheretsk; and then he was to return, or the garrison would be without an officer. The

Portrait of a WOMAN of KAMTSCCHATKA.

Portrait of a MAN of KAMTSCCHATKA.

The Russians, in Kamtschatka, could not furnish us with a better account of Synd than Mr. Cox has given us; though they seemed disposed to communicate, without reserve, what they really knew. From Major Behm we had received only this general information; that the expedition had miscarried, and that the Commander had been censured. It was evident, that he had been on the coast of America, south of Cape Prince of Wales; and as he was too far north to meet with sea otters, which the Russians seem to have in view in all their attempts at discoveries, it is probable, that his return without having made any, from whence commercial advantages might be reaped, was the cause of his disgrace, and on that account his voyage is spoken of with contempt by all the Russians. On Sunday, the 5th, all the parties that were on shore returned to the ship, and were employed in scrubbing her bottom, and getting in some shingle ballast. On Wednesday, the 8th, we hauled the Resolution on shore, in order to repair some damages she had received from the ice, in her cut-water. We began, about this time, to make a strong decoction from a species of dwarf pine, which is very plentiful in this country, judging it would hereafter be useful in making beer, and that we might perhaps be able to procure fugar, or a substitute, to ferment with it, at Canton. We knew, however, it would be an admirable medicine for the scurvy, and therefore were particularly desirous of procuring a considerable supply; as most of the preventatives with which he had furnished ourselves, were either consumed, or had lost their efficacy through long keeping. When we had prepared about a hoghead of it, the ship's copper was found to be remarkably thin, and that, in many places, it was even cracked. This obliged us to desist, and orders were given, that, for the future, it should be used as sparingly as possible. Those navigators, who may hereafter be engaged in long voyages, would act judiciously if they provided themselves with a spare copper, or, at least, they should be fully convinced, that the copper, usually furnished, should be remarkably strong and durable. These necessary utensils are employed in so many extra services, particularly in that important one of brewing antiscorbutic decoctions, that some such provision seems absolutely necessary; and the former appears the more eligible, because a much greater quantity of fuel would be consumed in heating coppers that are very thick.

Friday, the 10th, in the morning, the boats from both the ships were ordered to tow a Russian galliot into the harbour, which had just arrived from Okotik. She had been no less than 35 days on her passage, and, from the Light-house, had been observed a fortnight before, beating up towards the mouth of the bay. The crew had at that time dispatched their boat on shore, in order to procure water, which they much wanted; but, the wind increasing, the boat was lost: the galliot was again driven to sea, and those who were passengers suffered, with the crew, inconceivable hardships. On board this galliot were fifty soldiers, with their wives and children; they had also other passengers, and the crew consisted of 25 seamen, making in the whole, upwards of 100 persons; which, for a vessel of 80 tons, was a great number, especially as she was heavily laden with stores and provisions. This galliot, and the sloop which we saw here in May, are built in the manner of the Dutch doggers. Soon after the vessel had come to anchor, we were visited by a Put-parouchich, or sub-lieutenant, who arrived in her, and sent to take the command of this place. Some of the soldiers were intended to reinforce the garrison; and two pieces of cannon were brought on shore, to serve as an additional defence to the town; for, the honest serjeant observed shrewdly; that, as we had found the way here, others might do the same, who would not be so welcome as ourselves. On the 11th, the damages of the Resolution being repaired, we hauled her off from the shore, and, in the course of the day, we got some pitch, tar, cordage, and twine from the galliot. She also furnished us with 140 skins of flour, amounting to 13,782 English pounds troy weight. On the 12th, Ensign Synd left us to return to Bolcheretsk, with the remainder of the soldiers

who had arrived in the galliot. During his abode here, he had been our constant guest; and, on his father's account, we thought him in some degree belonging to us; and, as one of the family of discoverers, entitled to a share of our esteem. The serjeant, as being commander of the place, had hitherto been admitted to our tables; and his company was additionally welcome to us, because he was sensible and quick in his conceptions; and comprehended, better than any other person, the few Russian words that we had acquired. Whilst Ensign Synd remained among us, he very politely permitted him to enjoy the same privileges; but when the new Commander arrived from Okotik, the serjeant, for what cause we did not understand, fell into disgrace, and was no longer permitted to sit in the company of his own officers. Our endeavours to obtain indulgence for him, we perceived would have been ineffectual; for, though highly agreeable to us, it was, perhaps, incompatible with their discipline.

On Wednesday, the 15th, we had completed the stowage of the holds, got our wood and water on board, and were ready for sea; but we could not think of taking our departure, because the cattle were not yet arrived from Verchnei; and fresh provisions were now become the most important article of our wants, and essentially necessary for preserving the health of our people. Having before us a prospect of fine weather, we considered this as a favourable opportunity of engaging in some amusement on shore, and of acquiring some knowledge of the country. A party for bear-hunting was therefore proposed by Captain Gore; and on Friday, the 17th, we set out on this expedition; which was deferred to that day, in order to give a little rest to the Hospodin Ivaskin, a new acquaintance, who had arrived here on Wednesday, and intended to be one of our party. Major Behm had desired this gentleman, who resided usually at Verchnei, to attend us on our return to the harbour, and assist us as an interpreter; and, from what we had heard of him before his arrival, our curiosity to see him was much excited. He is allied to a considerable family in Russia, and his father was a general in the service of the Empress. He received his education partly in France; he had been a page to the Empress Elizabeth, and bore an Ensign's commission in her guards. At 16 years of age he was knowed, had his nose slit, and was banished to Siberia. He was afterwards transported to Kamtschatka, and had resided there 31 years. His person was tall and thin, and his visage furrowed with deep wrinkles. Old age was strongly depicted in his whole figure, though only 53 years of his existence had scarcely elapsed. Great was our disappointment when we discovered, that he had so totally forgotten the French and German languages, as not to be able to speak a single sentence, nor to comprehend readily any thing that was said to him in either of those languages. Thus were we deprived unfortunately, of what we expected would have furnished a favourable opportunity of acquiring further information respecting this country. The cause of his banishment remained a secret to every one in this country, but it was generally supposed, he had been guilty of some atrocious offence; especially as several of the Commanders of Kamtschatka have exerted their interest to get him recalled, in the reign of the present Empress; but, so far from succeeding in their applications, they were not able to change the place of his banishment. He assured us that, for 20 years, he had not tasted a morsel of bread, nor had been allowed any kind of subsistence; but had lived, all that time, with the Kamtschadales, on what he had procured from the chase by his own activity and toil. Afterwards a small pension was allowed him, and his situation has been rendered much less intolerable, since Major Behm was appointed to the command. Being noticed by so respectable a character, who often invited him to become his guest, others were induced to follow his example. The Major had also occasioned his pension to be augmented to 100 roubles a year, which is an Ensign's pay in every other part of the Empress's dominions, but in this province, all the officers have double pay. Major Behm informed us, that he

he had obtained permission for him to go to Okotsk, where he was to reside in future; but that, at present, he should leave him behind, as he might probably be useful to us as an interpreter, on our return to the Bay.

We now set out on our hunting party, directing our course to the northward, toward a pool of water, that lies near the mouth of the river Paratounka, and which was a known haunt of the bears. We had scarce landed, when unfortunately the wind changed to the eastward, and destroyed all hopes of coming up with our game; for the Kamtschadales assured us, that it was in vain to expect to meet with bears, when to the windward of them; owing to their being possessed of an uncommon acuteness in scenting their pursuers, which enabled them, under such circumstances, to avoid the danger, though at a very great distance from them. We returned therefore to the boat, and passed the night on the beach, having brought a tent with us for that purpose. The next morning, being the 18th, we crossed the bay, and pursued our course on foot along a plain, abounding with berries, on which the bears feed; but though several of these animals were seen at a distance, we could never contrive, the weather being showery and unfavourable, to get within shot of them. Thus disappointed again, we changed our diversion to that of spearing salmon, which we saw pushing in great numbers through the surf into a small river. Fortunately the water afforded us a little provision; for ill success had not only attended us in the chase by land, but we had failed in our expectations of shooting wild fowl, after having almost depended solely upon a supply of them for our subsistence; and on its failure, we began to think it time to return to head quarters. These sentiments entirely corresponded with those of the Hospodin, whom former ferocities had rendered unable to endure fatigue. On Sunday, the 19th, at night, we reached the ships, after having been full 12 hours upon our legs. Poor Ivaskin seemed perfectly overcome with fatigue, and was probably the more sensibly affected by it, for want of a supply of snuff; for, almost at every step, his hand sunk mechanically into his pocket, and rose instantly again with his huge empty box. When arrived at the tent, the Hospodin's box was immediately replenished, and, regaling upon a good supper, we forgot the fatigues and disappointments of our fruitless excursion.

On Monday, the 20th, we received the disagreeable intelligence, that our much esteemed friend, the serjeant, had suffered corporal punishment, which had been inflicted on him by command of the old Put-parouchick. None of us could learn the cause of his displeasure; but it was supposed to have arisen from some little jealousy, which had been excited by our civility to the former. We were unwilling to remonstrate on this subject, till Captain Shmaleff should arrive; however, when we were next visited by the Put-parouchick, the coolness with which we received him, must have testified fully our chagrin. The 22d, being the anniversary of the King's Coronation, we fired 21 guns; and, in honour of our Royal Master, prepared as elegant a feast as our situation would allow of. The arrival of Captain Shmaleff was announced the very moment we were sitting down to dinner. We were equally pleased and surprized at this unexpected visit: first, because the Captain came so opportunely to take a share in the festivity of the day; and also, because we were lately informed, that the effects of a late illness had rendered him unequal to the journey. We had the satisfaction to hear this had been merely an excuse; and that, knowing we were distressed for tea and fugar, &c. he was hurt at the idea of coming empty handed, and therefore had deferred his setting out, waiting impatiently for the arrival of a sloop from Okotsk; but hearing no intelligence of her, and fearing we should sail before he had visited us, he was resolved to prosecute the journey, though he had nothing to present to us but apologies for the poverty of Bolcheretsk. At the same time he informed us, that the reason of our not having received the black cattle, was, that the heavy rains at Verchnei, had prevented their setting out. So much generosity and politeness demanded the best answer we were capable of making;

and on coming on board the next day, we saluted him with 11 guns. Friday, the 24th, he was entertained on board the Discovery; and the day following, being the 25th, he returned to Bolcheretsk. No intreaties could prevail on him to extend his visit, having, as he assured us, some expectations that the sub-governor-general would arrive in the sloop expected from Okotsk, he being on a tour through all the provinces of the governor-general of Jakutsk. Without any application from us, he reinstated the serjeant in his command, before his departure, having resolved to take the Put-parouchick with him. We also understood, that he was much offended with him for punishing the serjeant, as there did not appear to be the slightest grounds for inflicting such chastisement. Encouraged by the Captain's great readiness to oblige us, we ventured to request a small favour for another inhabitant of Kamtschatka. It was to requite an honest old soldier, who kept a kind of ordinary for the inferior officers, and who had done a thousand good offices both for them and the whole crew. The Captain obligingly complied with our wishes, and dubbed him instantly a corporal, telling him, at the same time, to thank the English officers for his very great promotion. It may not here be unnecessary to remark, that the lower class of officers in the Russian army, have a greater pre-eminence above the private men, than those in the British service can possibly conceive. It was, indeed, a matter of astonishment to us, to see a serjeant assume all the state, and exact as much homage from those beneath him, as though he had been a field-officer. Besides there are several gradations of rank among them, of which other countries are wholly ignorant; there being no less than four intermediate steps between a serjeant and a private soldier. But the discipline of the Russian army, though so extremely remote from the seat of government, is remarkable for its strictness and severity; not exempting even the commissioned officers. Imprisonment, and bread and water diet, is the punishment of the latter for inconsiderable offences. A good friend of ours, an Ensign in this place, informed us, that the punishment he received for having been concerned in a drunken frolic, was three months imprisonment in the black hole, with a daily allowance only of bread and water for his subsistence; which so affected his whole nervous system, that he has never since enjoyed a sufficient flow of spirits to qualify him for a convivial meeting. Captain King attended Captain Shmaleff as far as the entrance of Awatska river, and, having taken leave of him, embraced that opportunity of visiting the priest of Paratounka.

On Sunday, the 26th, Captain King attended him to his church, where his whole congregation consisted of his own family, three men, and the same number of boys, who assisted in the singing; and the whole of the service was performed with great solemnity, and devotion. Though the church is of wood, it is much superior to any other edifice, either in this town, or that of St. Peter and St. Paul. Among several paintings with which it is ornamented, are two pictures of St. Peter and St. Paul, the Apostles, presented by the navigator, Beering, and which may vie with the first European performances, in the intrinsic richness of their draperies, the principal parts thereof being composed of thick plates of real solid silver, so fashioned as to imitate the foldings of the robes which decorate the figures, and fixed upon the canvass. Monday, the 27th, was spent by another party in the diversion of bear-hunting; when Captain King submitted himself to the directions of the parish-clerk, who had acquired great reputation as a bear hunter. About sun-set they arrived at one of the larger lakes, where it was deemed necessary to conceal themselves; and this was effected easily among some long grass, and brush-wood, of which we saw great plenty near the water's edge. We had not been long under our covert, before our ears were agreeably saluted with the growling of bears, in almost every quarter round about us; and we soon had the pleasure of beholding one of them in the water, swimming in a direct course to where we lay concealed. At this time the moon shone, so as to afford a considerable light; and as the

the bear advanced toward us, three of us fired at it, almost at the same instant. Immediately the animal turned short upon one side, and set up a most horrible noise, which was neither yelling, growling, nor roaring, but a very extraordinary mixture of the whole three. We could easily perceive, that the beast was wounded severely, and that it reached the bank with difficulty; whence it retreated to some thick bushes not far distant, still continuing to make a hideous noise. The Kamtschadales supposed it to be mortally wounded; but judged it an act of imprudence to attempt to rouse it again immediately. It was then nine o'clock; and as the night became overcast, and a change of weather was to be apprehended, we thought it advisable to return home, and wait till morning for the gratification of our curiosity, when we accordingly repaired to the spot, and found the bear dead from the wounds it had received. It was a female, and larger than the ordinary size.

This account of our hunting party may convey a wrong idea of the method pursued usually in this sport; to prevent which, it may not be amiss to subjoin a few words to this subject. The natives generally contrive to reach the ground about sun-set, where the bears usually frequent. They first look out for their tracks, and attend particularly to the freshest of them; always paying a regard to the situation with respect to concealment; and taking aim at the animal as it passes by, or advances, or goes from them. These tracks are numerous between the woods and the lakes, and are often found among the long sedge grass and brakes on the margin of the water. Having determined upon a convenient spot for concealment, the hunters fix their crutches in the ground, on which they rest their firelocks, pointing them in a proper direction. They afterwards kneel or lie down, as the circumstances of their situation may require; and, having their bearspears in readiness by their side, wait the arrival of their game. These precautions are extremely necessary, that the hunters may make sure of their mark: for the price of ammunition is so high at Kamtschatka, that the price of a bear will not purchase more of it than will load a musquet four or five times. It is much more material on another consideration; for, if the first shot should not render the bear incapable of pursuit, fatal consequences too frequently ensue. The enraged beast makes immediately towards the place from whence the sound and smoke issue, and furiously attacks his adversaries. They have not sufficient time to reload their pieces, as the bear is seldom fired at till he comes within the distance of 15 yards; therefore, if he should not happen to fall, they immediately prepare to receive him upon their spears; their safety depending, in a great measure, on their giving him a mortal stab as he advances towards them. Should he parry the thrust (which these animals are sometimes enabled to do, by the strength and agility of their paws) and break in upon his opponents, the conflict becomes bloody; for it is seldom that the loss of a single life will satisfy the beast's revenge. This business, or diversion, is particularly dangerous at two seasons of the year: in the spring, when they first issue from their caves, after having subsisted the whole winter (as it is here positively asserted) solely on sucking their paws; and especially if the frost should continue to be severe, and the ice in the lakes is not broken up; as they cannot then have recourse to their customary and expected food. Thus becoming exceedingly famished, they grow fierce and savage in proportion; pursuing the inhabitants by the scent; and prowling about at a distance from their usual tracks, dart upon them unawares. Under such circumstances, as the natives have no idea of shooting flying, or running, or in any manner without resting their piece, they often fall a sacrifice to their savage rapacity. The time of their copulation, is the other dangerous season to meet with them, and that is usually about September. Many instances of natural affection in these animals are frequently related by the Kamtschadales, who hence derive considerable advantages in hunting. They never presume to fire at a

No. 77.

young bear if the dam is upon the spot; for, if the cub should happen to be killed, she becomes enraged to an immoderate degree; and, if she can only obtain a sight of the offender, she is sure to be revenged of him, or die in the attempt. On the other hand, if the mother should be shot, the cubs continue by the side of her after she has been a long time dead; exhibiting, by affecting gestures and motions, the most poignant affliction. The hunters, instead of commiserating their distresses, embrace these opportunities of destroying them. If the veracity of the Kamtschadales may be depended on, the sagacity of the bears is as extraordinary as their natural affection. Innumerable are the stories which they relate to this effect. They likewise acknowledge infinite obligations to the bears, for all the little progress they have hitherto made in several arts. They confess themselves indebted wholly to those animals for all their knowledge in physic and surgery; that, by observing what herbs they have applied to the wounds they have received, and what methods they have pursued when they were languid, and out of order, they have acquired a knowledge of most of those simples which they have now recourse to, either as external or internal applications. But the most singular circumstance of all is, that they admit the bears to be their dancing-masters, though the evidence of our own senses places this matter beyond dispute; for in the bear-dance of the Kamtschadales, every gesture and attitude peculiar to that animal, is faithfully exhibited. All their other dances are similar to this in many particulars; and those attitudes are thought to come nearest to perfection, which most resemble the motions of the bear.

On Tuesday, the 28th, Captain King returned from his excursion to the ships, not a little pleased, as it had afforded him an opportunity of seeing a part of the country, and of observing the manners and behaviour of the people, when under no restraint, evidently not the case when they were in company with the Russians. On the 30th, our Commodore went to Paratounca; but, before his departure, ordered Captain King to get the ships out of the harbour, that they might be in readiness to sail.

On Friday, the 1st of October, we had a violent gale of wind, which continued the whole day; but, on the 2nd, both ships warped out of the harbour, and anchored in 7 fathoms water, about a quarter of a mile from the ostrog. Fortunately for us, the day before we quitted the harbour, the cattle from Verchnei arrived; and that the men might have the full enjoyment of this seasonable supply, by eating it whilst it was fresh, the Commodore determined to stay in our present station five or six days longer. This time, however, was far from being misapplied; for the pumps, sails, and rigging of each ship, received an additional repair. Captain King having obtained permission to use the copper belonging to the Resolution, and being supplied with molasses from Captain Gore, he was enabled to brew a sufficient quantity of beer to last the crew a fortnight, and to make ten additional puncheons of strong spruce essence. This supply was the more acceptable, as our last cask of spirits was now serving out, except a small quantity reserved for cases of emergency. The 3d being the name-day of the Empress of Russia, we were cordially disposed to shew it every possible respect. The pastor of Paratounca, Ivaskin, and the Serjeant, were invited to dine with us; and an entertainment was prepared for the two Toions of Paratounca, and St. Peter and St. Paul; as well as for the inferior officers of the garrison, and the most respectable of the inhabitants. All the other natives were invited to partake in common with the ships companies; a pound of excellent beef being served out to every man, and the remainder of our spirits was made into grog, and distributed among them. Twenty-one guns were fired upon the occasion; and considering we were in a very remote part of the Empress's dominions, the whole festival was conducted in a manner not unworthy so illustrious a character. On Tuesday, the 5th, we received a fresh supply of tea, sugar, and tobacco, from Bolcheretk. Captain Shmaleff having met this present

on his return, he transmitted a letter with it, informing us, that the sloop from Okotk had arrived in his absence, and that Madame Shmaleff had instantly dispatched a courier with these few articles, requesting our acceptance of them. On the two following days we were prevented from unmooring by reason of foul weather; but on Friday the 8th, all the boats were hoisted in, and we sailed towards the mouth of the bay; when the wind, veering to the S. obliged us to drop anchor, the Ostrog bearing N. distant half a league. On the 9th, at four o'clock, P. M. we again unmoored; but as we were raising our last anchor, we were informed that the drummer of the marines had fled from the boat of the Discovery, which had just left the village, and that he had lately been seen with a Kamtschadale woman, to whom he was known to be much attached, and who had importuned him frequently to stay behind. This man was entirely useless in the service, being lamed by a swelling in his knee; and on that very account Captain King was the more unwilling to leave him behind, lest he should become a miserable burthen to himself and the Russians. He therefore applied to the Serjeant to send parties of his men after him; and, in the mean time, some sailors visited a well known haunt of his in the neighbourhood, where the drummer and his woman were found together. On his return the Discovery weighed anchor, and followed the Resolution.

Having now taken our final departure from St. Peter and St. Paul, an account of Awatka Bay, and the adjoining coast, may not be unacceptable to our friendly readers; especially as it is, perhaps, the safest and most extensive bay that has ever been discovered; and the only one, in this part of the world, that can admit vessels of a considerable burthen. The entrance thereto is in the lat. 52 deg. 51 min. N. long. 158 deg. 48 min. E. It lies in the bight of another exterior bay, formed by Cape Gavareea to the S. and Cheepoonkoi Nofs to the N. The latter of these head-lands bears from the former N. E. by N. and is 32 leagues distant. From the Cape Gavareea to the entrance of Awatka Bay, the coast takes a northerly direction, and extends about 11 leagues. It consists of ragged cliffs and rocks, and, in many parts, presents an appearance of bays and inlets; but, on a nearer approach, low grounds was seen to connect the head-lands. From the entrance of Awatka Bay, Cheepoonkoi Nofs, bears E. N. E. distant 17 leagues. The shore on this side is flat and low, with hills behind, rising gradually to a considerable height. The latitude of Cape Gavareea is 52 deg. 21 min. This remarkable difference of the land on the sides of Awatka Bay, together with their different bearings, are very proper guides to steer for it, in coming from the southward; and when it is approached from the northward, Cheepoonkoi Nofs becomes very conspicuous; it being a high projecting head-land, and is united to the continent, by a large extent of level ground, lower than the Nofs. We are rather particular in describing this coast; for if we had possessed a good account of its form on both sides of Awatka Bay, we should, when we first visited it, have arrived two days sooner than we did, and consequently have avoided part of the tempestuous weather, which we experienced in plying off the mouth of the harbour. Besides, as the fogs are so prevalent in these seas, it often happens, that an observation for ascertaining the latitude cannot be taken. It should also be considered, that land makes a very deceptive appearance when covered with snow, or when viewed through a hazy atmosphere; both which circumstances render it necessary for every navigator to be acquainted with as many discriminating objects as possible. Should the weather be sufficiently clear to admit a view of the mountains, both on the coast and its neighbourhood, the situation of Awatka Bay may be precisely known, by the two high mountains to the S. of it. That nearest the bay is in form of a sugar-loaf: the other, more inland, is flat at top, and not quite so high. There are three very conspicuous mountains to the N. of the bay: that farthest to the W. appears to be the highest; the next, a volcano-mountain, may readily be known by the smoke issuing from the

top. The third is the most northerly, and might, with some propriety, be called a cluster of mountains, as it presents several flat tops to our view. When we got within the capes, and into the outward bay, a light-house on a perpendicular head-land, pointed out the entrance into the harbour to the N. Many funken rocks lie to the eastward of this head-land, stretching two or three miles into the sea, and when this or a swell are moderate, they will always shew themselves. To the S. of the entrance, about 4 miles distant from it, lies a small round island, composed chiefly of high pointed rocks, one of which is larger, and more perpendicular than the rest. The entrance into the bay is, at first, about three miles wide; one mile and a half in the narrowest part; and it is four miles long, in a N. N. W. direction. Within the mouth is a noble basin, 20 miles in circumference, in which are the harbours of Rakowena to the E. Tarcinska to the W. and St. Peter and St. Paul to the N. The breadth of Tarcinska harbour is three miles, and the length twelve. A narrow neck of land separates it from the sea at the bottom, and it stretches to the E. S. E. The entrance of the harbour of Rakowena is impeded by a shoal in the middle of the channel, which, in general, makes it necessary to warp in, unless there should happen to be a leading wind. Were it not for this circumstance, this harbour would be preferable to the other two. It is one mile and a half broad, and three miles long, running in a S. E. and easterly direction.

But, one of the most convenient little harbours we have seen, is that of St. Peter and St. Paul. Six ships may be commodiously moored in it, head and stern, and it is, in every respect, convenient for giving them any kind of repairs. The S. side of this harbour is formed by a low, narrow, sandy neck, whereon the Ostrog is built. The mid-channel is only 270 feet across, in which there was six fathoms and a half water. The deepest within is 7 fathoms, over a muddy bottom. We found, however, some inconvenience from the toughness of the ground, which often broke the messenger, and occasioned some trouble in getting the anchors up. At the head of this harbour is the watering place. Off the eastern harbour is a shoal, and within the entrance a spit, stretching from the S. W. shore, having only three fathoms water over it. To steer clear of the latter, a small island, or rather a large detached rock, on the W. shore of the entrance, must be shut in with the land to the S. of it. In order to steer clear of the former, the three needle rocks, near the light-house-head, on the E. shore of the entrance, must be kept open with the head-lands to the northward of the first small bending on the E. side of the entrance. As you come into the harbour of St. Peter and St. Paul, and approach the village, it is very necessary to keep near the eastern shore, to avoid a spit which stretches from the head-land, to the S. W. of the Ostrog.

Let it be noticed, that the observatories were placed on the W. side of the village of St. Peter and St. Paul; and from the sun's meridian altitudes, and of five stars to the N. of the zenith we found the latitude to be 53 deg. 38 sec. N. and its longitude from 146 sets of lunar observations, to be 158 deg. 43 min. 16 sec. E. At full and change of the moon it was high water, at 36 min. after four; and five feet eight inches, was the greatest rise. The tides were regular every twelve hours. It may be proper to observe further, in this place, that the time-keeper on board our ship, which was copied exactly from Mr. Harrison's, by Mr. Kendal, stopped on the 27th of April, a few days before our first arrival in Awatka Bay. During the voyage, it had always been carefully attended to, not having been trusted, even for a moment, in any other hands than those of Captain Cook and Captain King. No accident, therefore, could possibly have happened, to which its stopping could be attributed; nor could it proceed from intense cold, the thermometer being but very little below the freezing point. When the failure of the piece was first discovered, the Commodore and Captain King consulted about the measures to be pursued; whether they should suffer it to remain in a useless state, or submit

A View of the Town and Harbour of ST PETER and ST PAUL, in KAMTSCHATKA

mit it to the inspection of a seaman on board, who had been regularly bred a watch-maker in London, and who had given many satisfactory proofs of his skill in that profession, in repairing several watches upon the voyage. Having experienced the accuracy of this time-piece, we were extremely unwilling to be deprived of its advantages. Besides, it should be considered, that the watch had already been sufficiently tried to ascertain its utility, as well in the former voyage, as during the three years of our having it on board: therefore, on the first clear day after we arrived in Awatka Bay, the time-piece was opened, in the presence of the two Captains, Clerke and King. No part of the watch appeared to be broken; but as the watch-maker was not able to make it go, he took off the cock and balance, and cleaned the pivot-holes: these were extremely foul; and other parts of the work were in the same condition. Upon taking off the dial-plate, a piece of dirt was found between two teeth of the wheel, that carries the second hand, to which cause its stopping was principally attributed. After putting the work together, and oiling it very sparingly, the watch seemed to go with freedom and regularity. Captain King having received orders to go the next day to Bolcheretk, the time-keeper was left with Mr. Baily, in order to get its rate, by comparing it with his watch and clock; who informed him on his return, that it had gone very regularly for some days, not losing more than 17 seconds a day; and afterwards stopped again. This we supposed to be occasioned by its having been badly put together. It was therefore now a second time opened; and when again adjusted, it gained about a minute a day; when, the watch-maker in attempting to alter the regulator, broke the balance-spring. He made a new spring, but the watch went so irregularly afterwards, that we were obliged to lay it aside as quite useless. The honest mechanic was as much vexed as we were at our ill success; not so much owing, as we were convinced, to his want of skill, as to the improper tools he had to work with, and the callousness his hands had contracted from his employment as a mariner. We shall now proceed, as proposed in the contents of this chapter, to give a correct and perfect geographical and natural history of the Peninsula of Kamtschatka.

Kamtschatka is situated on the eastern coast of Asia. It extends from 52 deg. to 61 deg. N. lat. the long. of its extremity to the S. being 156 deg. 45 min. The isthmus, that joins it to the continent on the N. lies between the gulphs of Olutorok and Penshinsk. Its extremity to the S. is Cape Lapatka. The whole peninsula is somewhat in the form of a shoe; and its greatest breadth is 236 computed miles, being from the mouth of the Tigil, to that of the river Kamtschatka; and towards each extremity, it gradually becomes narrower. On the N. it is bounded by the country of the Koriacks; by the N. Pacific Ocean to the S. and E. and by the sea of Okotsk to the W. A chain of high mountains extends the whole length of the peninsula, from N. to S. and almost equally divide it; whence several rivers take their rise, and make their course into the Pacific Ocean, and the sea of Okotsk. The three principal of these are, the Bolchoireka, or great river; the Kamtschatka; and the river Awatka. To the N. W. of the mouth of the Kamtschatka, lies the great lake Nerpitsch; from Nerpi, a seal; that lake abounding with those animals. A fort, called Nishnei-Kamtschatka Ostrog, is situated about 20 miles up the river, where an hospital and barracks have been built by the Russians; and this place, we understood, is now become the principal mart in the country.

Were we to judge of this country from what we saw of its soil and vegetable productions, it appears to be barren in the extreme. Neither about the bay, nor in our journey to Bolcheretk, nor in any of our hunting excursions, did we ever perceive the smallest spot of ground, that had the appearance of a good green turf, or that seemed capable of improvement by cultivation. Indeed, the whole surface of the country, in a most striking degree, resembles that of Newfoundland. At Paratounka, however, we saw some stacks of most excel-

lent hay; and Major Behm assured us, that the banks of the Kamtschatka, and the Bistraia, as well as many other parts of the peninsula, produce a quantity of grass, of great strength and height, which is mowed twice in every summer, and that the hay is particularly adapted to the fattening of cattle, being of a very succulent quality. This agrees with Krascheninoff's account, who relates, that the country which borders on the river Kamtschatka, is much superior, in point of fertility, to that of either the N. or S. The severity of the climate, it may naturally be supposed, must be in proportion to the sterility of the soil, of which it is perhaps the cause. We first saw this country in the beginning of May, 1779, when it was covered with snow, from six to eight feet in depth. On the 24th of August, when we returned, the foliage of the trees, and vegetation in general, appeared to be in the height of perfection. The weather, during the remainder of that month, and the whole of September, was not severe; but when October began, the new fallen snow again covered the tops of the hills. In computing the seasons here, Spring should certainly be omitted. Summer may be said to extend from the middle of June, till the middle of September. October may be considered as Autumn; from which period to the middle of June, it is all dreary winter. The climate in the country adjacent to the river Kamtschatka, is said to be as serene and temperate, as in many parts of Siberia under the same latitude. The inhabitants, however, are sometimes prevented, by the uncertainty of the summer season, from providing a sufficient stock of dried fish, for their food in winter; and the moisture of the air occasions worms to breed in them, which frequently destroy or spoil the greatest part. The severity of the winter, and the dreadful hurricanes of wind and snow which attend it, oblige the natives to retire to their subterraneous habitations, both for their security and warmth. We had neither thunder nor lightning during our stay at Kamtschatka, excepting on the night of the eruption of the volcano. In this peninsula volcanoes are numerous; but only three have lately been subject to eruptions. That in the neighbourhood of Awatka we have already mentioned. The volcano of Tolbatchick is situated between the river Kamtschatka and Tolbatchick, on a neck of land. The eruptions proceed from the summit of a high mountain, which terminates in pointed rocks. On the top of the mountain of Kamtschatka, supposed to be by far the highest in the peninsula, is the third volcano. Springs of hot water are said to abound in this country.

The principal trees which fell under our notice, were the birch, the poplar, and the alder; several small species of the willow, and two sorts of dwarfish cedars. One of these sorts grows upon the coast, seldom exceeding two feet in height, and creeping on the ground. Of this our essence for beer was made, and proved to be very proper for the purpose: the other, which grows much higher, is found on the mountains, and bears a kind of nut or apple. Of the birch which appears to be the most common, we remarked three sorts. Two of them were large and fit for timber; differing from each other only in the colour and texture of the bark. The third is of a dwarfish kind. The natives apply this tree to a variety of uses. When tapped, it yields a liquor in great abundance, which they drink without mixture, or any kind of preparation, as we observed frequently in our journey to Bolcheretk. We drank some of it ourselves, and found it pleasant and refreshing, though somewhat purgative. The bark they convert into vessels for domestic purposes; and from the wood of this tree are made their sledges and canoes. Not only the birch, but every other kind of tree, in the neighbourhood of the bay, were stunted, and very small: the natives therefore are obliged to go a considerable distance up the country, to get wood of a proper size for their canoes, their balagans (or summer-houses) and many other purposes. This peninsula likewise produces great abundance of the shrub kind, as mountain ash, junipers, raspberry bushes, and wild roses. Also a variety of berries, as partridge-berries, blue-berries, black-berries, cran-berries, and crow-berries. These are preserved by mashing them.

them into a thick jam; and they constitute a considerable part of their winter provisions, serving as a general sauce to their dried fish. They also eat them in puddings, and make decoctions of them for their common beverage. We found here large quantities of wholesome vegetables in a wild state, such as chervil, garlic, onions, angelica, and wild celery. We also met with some excellent turnips, and turnip-radishes, upon a few spots of ground in the vallies. This was the utmost of their garden cultivation: yet, this account of vegetables only relates to such parts of the country as fell within our observation: near the river Kamtschatka, where, as we have already observed, both the soil and climate are the best in the peninsula, garden culture is attended to, and perhaps with success; for, with the second drove of cattle which we received from Verchnei, we also received a present of cucumbers, celery, some large turnips, and other garden vegetables. Two plants are produced in this peninsula, which must not pass unnoticed. The first is called by the natives Sarana, which grows wild and in great quantities. About the beginning of August, many women are employed in collecting the roots, which, after being dried in the sun, are preserved for use. It is a maxim with the Kamtschadales, that Providence never deserts them, for the season that is prejudicial to the sarana, is always favourable for fishing; and, on the contrary, an unsuccessful fishing month, is always amply compensated by an exuberant sarana harvest. This article is variously employed in cookery. When roasted in embers, it is a better substitute for bread than any thing the country produces. When baked in an oven, and pounded, it supplies the place of flour and meal, and is mixed in all their soups, and many other dishes. It is extremely nourishing, has a pleasant bitter flavour, and may be eaten daily without cloying. We partook of these roots, boiled as we do potatoes, and found them very agreeable. The name of the other plant is Sweet Grass. When at its full growth, it is about six feet high. This plant was formerly a principal ingredient in cookery among the natives; but since the Russians have been in possession of the country, it has been chiefly appropriated to the purpose of distillation. The liquor extracted is called raka, and has the strength of brandy. Seventy-two pounds of the plant, produce generally 25 pints of raka. A vulgar well-known plant remains to be noticed, as being more essential to their subsistence than all which have hitherto been mentioned: this is the Nettle; which, as neither hemp nor flax are produced in this country, supplies materials for their fishing-nets; and on which their existence principally depends.

Many parts of this peninsula would probably admit of such cultivation, as might contribute to the comfort and convenience of the inhabitants; yet the number of wild animals it produces, must always be considered as its real riches; and no labour can be considered so productive of advantage, as what is employed upon its furreries. And next to these, the animals that supply them are deserving of attention. These are the fox, the zebiline, or sable; the stoat, or ermine; the isatis, or arctic fox; the earless marmot; the varying hare; the weasel; the glutton, or wolverene; the wild sheep; the rein-deer; wolves; bears; and dogs. The most general objects of the chase are foxes, with which this country abounds, and among which are a variety of colours. The most common species is the same as the European, but their colours are more vivid and shining. Some are of a dark chestnut; others have dark-coloured stripes; the bellies of some are black, but the other part of the body is of a light chestnut. Some are wholly black; others of a dark brown; others of a stone-colour; and some few are entirely white; the last, however, are very scarce. The quality of their fur is much superior to that of the same animals in Siberia or America. The sables are much larger than those of Siberia, and their fur is thicker and brighter; but those in the neighbourhood of the rivers Olekma and Vitima, are of a finer black. The sables of the Tigil and Ouka, are said to be the best in Kamtschatka; a pair of these being sold frequently for five pounds sterling. The inferior sorts are found in the southern parts.

A rifle barrel gun, of a very small bore, a net, and a few bricks, are the whole apparatus of the sable hunters. With the first they sometimes shoot them, when seen on trees: the net is used in surrounding hollow trees, in which they usually take refuge when pursued; and the bricks are put hot into the cavities, in order to drive them out with the smoke. The skin of the arctic fox is of little value; and, on the same account, the varying hare is neglected. They are very numerous, and always become perfectly white during the winter. In the beginning of May, we observed several of this colour, but they were so extremely shy, as not to suffer us to come within gun-shot. The earless marmot, or mountain rat, is a beautiful creature, much smaller than a squirrel; and, like that animal, feeds upon roots and berries. Its skin is of high estimation, being warm, light, and of a bright shining colour. The ermine, or stoat, is little regarded; its fur being of a very ordinary kind. The weasel is also neglected on the same account. The skin of the wolverene, or glutton, on the contrary, is in the highest repute; a Kamtschadale looking upon himself as most splendidly attired, when a small quantity of this fur appears upon his garments. The women embellish their hair with its white pats, which is considered as the most superlative piece of finery. All the bears which we had an opportunity of seeing, were of a dun brown colour. They appear generally in a company of four or five together; and frequently in the season when the fish quit the sea, and push, in great quantities, up the rivers. In the winter months they are seldom visible. Of their skins, warm mattresses, and coverings for beds, are made; also comfortable bonnets, gloves, and harnesses for the sledges. The flesh, especially the fat, is held in great estimation. The wolves appear only in winter, when they are said to prowl about in large companies. Rein-deer, both wild and tame, are found in many parts of the peninsula, but none in the neighbourhood of Awatka. It is remarkable that these animals are not used here, for the purposes of carriage, as they are by their neighbours to the N. and E. Their place is indeed sufficiently supplied by dogs; yet it appears somewhat extraordinary, that they should not have preferred an animal so much more powerful and docile. The dogs resemble the Pomeranian breed, in mien and figure; but they are larger, and the hair is considerably coarser. The colour most prevalent among them, is that of a light dun, or a pale dirty yellow. These animals are all turned loose, about the latter end of May, and are obliged to shift for themselves till the ensuing winter; but they never fail to return to their respective homes, when the snow begins to make its appearance. In the winter, their food consists wholly of the head, back-bones, and entrails of salmon, which are preserved and dried for that purpose; and even with this food they are very scantily supplied. The dogs must certainly be very numerous, no less than five being yoked together for a single sledge, in which only one person is carried. In our journey to Bolcheretsk, we had occasion for 139 at two stages. It is observable, that bitches are never employed in this business, nor dogs that have been castrated. The whelps are trained to the draft, by being fastened to stakes with leathern thongs, which are elastic; and having their food placed beyond their reach, by continually pulling to obtain it, they acquire strength and a habit of drawing; both of which are essentially necessary for their destined labour. We must not omit, in our catalogue of animals, the wild mountain sheep, or argali, unknown in all parts of Europe, except those of Corsica and Sardinia. Its skin resembles that of a deer's, but, in its gait and general appearance, it nearer approaches the goat. Its head is adorned with two large twisted horns, which, when the animal is full grown, weigh sometimes from 25 to 30 pounds, and are rested on the creature's back when it is running. These animals are remarkable swift and active, frequent only the most craggy and mountainous parts, and traverse the steepest rocks with an astonishing agility. Spoons, cups, and platters, are fabricated by the natives of their horns; and they often have one of the latter hanging to a belt; which serves them to drink

out of, when on their hunting expeditions. This is a gregarious creature, extremely beautiful, and its flesh is sweet, and delicately flavoured.

Of northern sea-fowl, almost every kind frequent the coast and bays of Kamtschatka, and among others the sea eagles. The inland rivers are plentifully stored with various species of wild ducks; one of which, called by the natives a-an-gitché, has a most beautiful plumage. Its cry is equally singular and agreeable. Another species is called the mountain duck. The plumage of the drake is remarkably beautiful. A variety of other water fowl were seen, which, from their magnitude, appeared to be of the goose kind. We observed in passing through the woods, some eagles of a prodigious size, but of what species we could not possibly determine. It is said, there are three different kinds. The first is the black eagle with a white head, tail, and legs: the eaglets of which are perfectly white. The second is improperly called the white eagle, though, in reality, it is of a light grey. The third is the stone coloured eagle, which is a very common sort. There are great numbers of the hawk, falcon, and bustard kind in this peninsula. Woodcocks, snipes, and grouse are also found here. Swans are very numerous, and generally make a part of the repast at all public entertainments. The vast abundance of wild fowl, in this country, was sufficiently manifest, from the many presents we received, consisting frequently of twenty brace at a time. We saw no amphibious animals on the coast, except seals, and these were extremely numerous about the bay of Awatka. The sea-otters found here, and those we met with at Nootka sound, are exactly the same; and have already been particularly described. They were formerly in great abundance here; but since the Russians have opened a trade with the Chinese for their skins, where they bear a price superior to any other kind of fur, the hunters have been induced to be so indefatigable in the pursuit of them, that very few remain in the country. They are still found in the Kurile Islands, though the number is inconsiderable.

Fish is the main article of subsistence among the inhabitants of this peninsula, who cannot possibly derive it either from agriculture or cattle. The soil, indeed, affords some wholesome roots, and every part of the country produces great quantities of berries; but fish alone may be called their staff of life, with more propriety than bread in any other country; for neither the inhabitants, nor their domestic animals of the canine species, could possibly exist without it. Whales are common in this country, and when taken serve for a variety of uses. After cleaning their intestines, drying them, and blowing them like bladders, they deposit their oil and grease therein. Excellent snares are made of their nerves and veins; in short, no part of the whale is useless in this peninsula. We caught abundance of fine flat fish, trout, and herrings. At one haul on the 15th of May, we dragged out above 300 flat fish, besides a considerable quantity of sea-trout. The first herring season commences about the latter end of May. They visit the coast in large shoals, but continue no considerable time. These fish are excellent, as are also large quantities of exceeding fine cod; and many of our empty casks were filled with the former. But notwithstanding this abundance, it is on the salmon fishery alone that the inhabitants depend for their winter sustenance. The fishing season begins about the middle of May, and continues to the end of June. The first shoals that enter the mouth of the Awatka, is the largest and most esteemed. Three feet and a half is their usual length; and they are more than proportionably deep; their average weight being from 30 to 40 pounds. We had one of the first that were taken, but not without being told, that it was the highest compliment the Kamtschadales could possibly confer upon us. It was formerly a custom among them to eat the first fish they caught, in the midst of great rejoicings, accompanied with many superstitious ceremonies. There is a smaller sort of salmon, weighing from about 8 to 15 pounds, known by the name of the red fish, which assemble in the bays, and at the mouths of the rivers, early in the month of

No. 78.

June. From this time till towards the end of September, vast quantities of them are taken upon the eastern and western coasts, where the sea receives any fresh water, and also up the rivers, almost to their very sources. All the lakes which communicate with the sea abound with fish, which have much the appearance of salmon, and weigh usually about five or six pounds. The natives, we understand, do not think it worth their labour to catch them. These lakes being generally shallow, the fish become an easy prey to bears and dogs, in the summer season; and from the quantities of bones appearing upon the banks, vast numbers of them seem to have been devoured. The natives dry the principal part of their salmon, and salt but very little of it. They cut a fish into three pieces. The belly-piece is first taken off; and then a slice along each side of the back bone. The former, which is esteemed the best, is dried and smoked: the other slices are dried in the air, and are either eaten whole as a substitute for bread, or pulverized for paste and cakes. The head, tail and bones, are dried, and preserved for their dogs.

The inhabitants of Kamtschatka may be divided into three classes; the Kamtschadales; the Russians and Cossacks; and a mixture produced by their intermarriages. The Kamtschadales are a people of remote antiquity, and have inhabited this peninsula for many ages; and they doubtless descended from the Mangaians; though some have imagined they sprang from the Tongusian Tartars, and others from the Japanese. The Russians, having made themselves masters of that vast extent of coast of the Frozen Sea, established posts and colonies, and appointed commissaries to explore and subject the countries still farther to the E. They soon discovered that the wandering Koriacs inhabited part of the coast of the sea of Okotsk, and they found no difficulty in making them tributary. These not being at a great distance from the Kamtschadales, with whom they had frequent intercourse, a knowledge of Kamtschatka must naturally follow; and the honour of the first discovery of this peninsula is attributed to Feodor Alexeieff, a merchant, in the year 1648; but a Cossack, named Volodimer Atlassoff is the unquestionable first acknowledged discoverer of Kamtschatka. He was sent in 1697, in the capacity of commissary from Jakutsk to the Anadirsk, with directions to call in the Koriacs to his assistance, in order to discover, and make tributary, the countries beyond theirs. With sixty Russian soldiers, and as many Cossacks, he penetrated, in the year 1699, into the heart of the peninsula, and gained the Tigil. In his progress he levied a tribute upon furs, and proceeded to the river Kamtschatka, on which he built an ostrog, now called Verchnei; and leaving a garrison of 16 Cossacks, returned to Jakutsk, with vast quantities of valuable tributary furs, in the year 1700. Since which time to the grand revolt of the Kamtschadales in 1731, the history of this country presents an unvaried detail of revolts, massacres, and murders, in every part of the peninsula. Though a great many of the inhabitants were lost, in quelling the rebellion of 1731, yet the country had afterwards recovered itself, and was become as populous as ever in 1767; at which period the small pox was, for the first time, introduced among them, by a soldier from Okotsk. It broke out with fury, and, in its progress, was as dreadful as the plague; seeming almost to threaten their entire extirpation. Twenty thousand were supposed to have died by this loathsome disorder in Kamtschatka, the Kurile islands, and the Koreki country. The inhabitants of whole villages were sometimes swept away; of which sufficient proof remains to this day. There are eight ostrogs about the bay of Awatka, which, we were informed, had been completely inhabited, but now they are all become desolate, except St. Peter and St. Paul; and only seven Kamtschadales, who are tributaries, reside in that. At the ostrog of Paratounca only 36 native inhabitants remain, including men, women, and children; though it contained 360 before it was visited by the small pox. We passed no less than four extensive ostrogs, in our journey to Bolcheretsk, which had not a single inhabitant

in either of them. We were informed by Major Behm, that those who at this time pay tribute, including the Kuriles, do not exceed 3,000. The amount of the military forces, in five forts, is about 400, including Russians and Cossacks. Nearly the same number are said to be at Ingiga; which, though in the N. of the peninsula, is under the command of Kamtschatka. The Russian traders and emigrants are not very considerable.

The government, established in this country by the Russians, considered as a military one, is remarkably mild and equitable. The natives are permitted to elect their own magistrates in their ancient mode. One of these, called a Toion, presides over each ostrog, to whom all differences are referred. In some districts, the only tribute exacted is a sable's skin; and in the Kurile islands, a sea otter's; but as the latter is considerably more valuable, the tribute of several persons is paid with a single skin; a tribute so inconsiderable can hardly be considered in any other light, than that of an acknowledgment of the Russian dominion over them. But the Russians are not only to be commended for the mildness of their government; they are also entitled to approbation for their successful endeavours in converting the natives to Christianity, there being now but very few idolaters remaining among them. If we form a judgment of the other missionaries from the benevolent pastor of Paratounca, more suitable persons could not possibly be engaged in this business.

The exports of this country consist entirely of furs; and this business is chiefly conducted by a company of merchants, appointed by the empress. Twelve was the number originally, but three have since been added. Besides a charter or grant of privileges, they are distinguished by wearing a gold medal, expressive of the Empress's protection of the fur trade. There are other inferior dealers, chiefly Cossacks, in different parts of the country. At what time the principal merchants remain here, they reside either at Bolcheretsk, or the Nishnei ostrog; the trade centering wholly in those two places. This business was formerly carried on in the way of barter, but every article is at present purchased with ready money, no inconsiderable quantity of specie being circulated in that wretched country. The furs produce a high price; and the natives require few articles in return. Our sailors brought a quantity of furs from the coast of America, and were both pleased and astonished on receiving such a quantity of silver for them from the merchants; but as they could not purchase gin or tobacco, or any thing else that would afford them any degree of entertainment, the roubles were soon considered as troublesome companions, and they frequently diverted themselves by kicking them about the deck. Our men received thirty roubles of a merchant, for a sea-otter's skin, and in the same proportion for others; but the merchant understanding they had great quantities to dispose of, and perceiving they were unacquainted with traffic, he afterwards procured them at a much cheaper rate.

European articles are the principal that are imported, but they are not solely confined to Russian manufactures. They come from England, Holland, Siberia, Bucharia, the Calmucs, and China. They chiefly consist of coarse woollen and linen cloths, stockings, bonnets, and gloves; thin Persian silks, pieces of nankeen, cottons, handkerchiefs, both of silk and cotton; iron stoves, bras and copper pans, files, guns, powder and shot; hatchets, knives, looking-glasses, sugar, flour, boots, &c. These commodities, we observed, sold for three times the sum they might have been purchased for in England. And, notwithstanding the merchants have so extravagant a profit upon these imported goods, they receive still a greater advantage from the sale of the furs at Kiachta, a considerable market for them on the frontiers of China. In Kamtschatka, the best sea-otter skins usually produce about thirty roubles a-piece; at Kiachta, the Chinese merchant gives more than double that price, and disposes of them again at Pekin for a much greater sum; after which, an additional profit is made of many of them at Japan. If, then, the original

value of a skin at Kamtschatka is thirty roubles, and it is afterwards transported to Okotsk, thence by land 1364 miles to Kiachta, thence 760 miles to Pekin, and after that to be transported to Japan, what a lucrative trade might be established between Kamtschatka and Japan, which is not above three weeks sail from it, at the utmost? It may be necessary to observe, that the principal and most valuable part of the fur trade, lies among the islands between Kamtschatka and America. Beer- ing first discovered these in 1741, and as they were found to abound with sea-otters, the Russian merchants fought anxiously for the other islands seen by that navigator, S. E. of Kamtschatka, named in Muller's map the islands of St. Abraham, Seduction, &c. They fell in with no less than three groups of islands, in these expeditions. The first, about 15 deg. E. of Kamtschatka; another, 12 deg. E. of the former; and the third, Oonalashka, and the neighbouring islands. These mercantile adventurers also proceeded as far as Shumagin's Islands, of which Kodiak is the largest. But here they met with so warm a reception, for attempting to compel the payment of a tribute, that they never ventured so far again. The three groups before-mentioned, however, were made tributary. The whole sea between Kamtschatka and America is, according to the Russian charts, covered with islands; for, as those who were engaged in these expeditions, frequently fell in with land, which they supposed did not tally with the situation laid down by preceding adventurers, they immediately supposed it to be a new discovery, and reported it accordingly on their return; and, as these vessels were usually out three or four years, and sometimes longer, such mistakes could not immediately be rectified. It is pretty certain, however, that only those islands which have been enumerated, have been discovered in that sea by the Russians, S. of 60 deg. latitude. The sea otter skins, which are certainly the most valuable article in the fur trade, are principally drawn from these islands; which being now under the Russian dominion, the merchants have factors residing in settlements there, for the sole purpose of bartering with the natives. To extend this trade, an expedition was fitted out by the admiralty of Okotsk, to make discoveries to the N. and N. E. of the above-mentioned islands, and the command of it given to Lieutenant Synd. But, as this gentleman directed his course too far N. he did not succeed in the object of his voyage; for, as we never found a sea-otter N. of Bristol bay, they, perhaps, avoid those latitudes where large amphibious sea-animals are numerous. The Russians have not since undertaken any expedition for making discoveries to the eastward; but they will, probably, make an advantageous use of our discovery of Cook's river. Notwithstanding the general intercourse between the natives, the Russians, and Cossacks, the former are as much distinguished from the latter by their habits and disposition, as by their features and general figure.

As the persons of the natives have already been described, we shall only add, that, in their stature, they are below the common height, which Major Behm attributes to their marrying so very early; both sexes usually engaging in the conjugal state at 13 or 14 years of age. They are exceedingly industrious, and may be properly contrasted with the Russians and Cossacks, who frequently intermarry with them, apparently, for no other reason, but that they may be supported in laziness and sloth. To this inactivity may be attributed those scorbutic complaints, which most of them are dreadfully afflicted with; whilst the natives, who exercise in the open air, entirely escape them.

Their habitations consist of three distinct sorts; jouts, balagans, and log-houses, which are here called isbas; they inhabit the first in the winter, and the second in the summer; the third are introduced by the Russians, wherein only the wealthier people reside. The jouts are thus constructed. A kind of oblong square is dug about six feet deep in the earth; the dimensions must be proportioned to the numbers who are to inhabit it, for it is usual for several to live together in the same jout. Strong wooden posts, or pillars, are fastened in the

View of the INSIDE of a WINTER-HABITATION, in KAMTSCHATKA.

the ground, at equal distances from each other, on which the beams intended to support the roof are extended; which is formed by joists, one end of which rest upon the ground, and the other on the beams. Between the joists, the interstices are filled up with wicker work, and turf is spread over the whole. The external appearance of a *jourt*, resembles a round squat hillock. A hole, serving for a chimney, window, and door, is left in the center, and the inhabitants go in and out by the assistance of a long pole, having notches deep enough to afford a little security for the toe. On the side, and even with the ground, there is another entrance, appropriated to the use of the women; but if a man passes in or out of this door, he becomes as much an object of ridicule, as a sailor who descends through lubber's hole. A *jourt* consists of one apartment, forming an oblong square. Broad platforms, made of boards, are extended along the sides, at the height of about six inches from the ground; which serve them for sitting on, and on which they repose; first taking care to cover them with mats and skins. The fire-place is on one side, and, on the other, their provisions and culinary utensils are stowed. When they make entertainments, the compliment is considered in proportion to the heat of the *jourts*; the hotter they are made, the more gracious is the reception of the guests considered. We always found them so extremely hot as to be intolerable. They generally retire to their *jourts* about the middle of October, and continue in them till the month of May is more than half expired. To erect a *balagan*, nine posts are fixed into the earth, in three regular rows, at equal distances from each other, to the height of about 12 or 13 feet from the surface. About 10 feet from the ground, rafters are laid from post to post, and securely fastened by strong ropes. The joists are laid upon these rafters, and a turf covering completes the platform or floor of the *balagan*. A roof of a conical figure is raised upon this, by means of long poles, which are fastened to the rafters at one end, and meet together in a point at the top. The whole is covered, or rather thatched, with a coarse kind of grass. These summer habitations have two doors, placed directly opposite to each other, to which they ascend by the same kind of ladders that are used in the *jourts*. In the lower part, which is left entirely open, they dry their fish, vegetables, and other articles intended for the consumption of the winter. Though six families usually live together in one *jourt*, a *balagan* is seldom occupied by more than one at a time. The *ibas*, or log-houses, are thus erected: long timbers are piled horizontally, with the ends let into each other, and the seams are filled up or caulked with moss. Like those of our common cottages, the roof is sloping, and thatched either with grass or rushes. Each log-house has three apartments in the inside. One end may be said to be a kind of entry, which extends the whole width and height of the house, and seems to be a kind of receptacle for their bulky articles, as sledges, harness, &c. This has a communication with their best apartment, which is in the middle, and is furnished with broad benches, calculated both for eating and sleeping upon.

A door leads from this into the kitchen, almost half of which is taken up with an oven, or fire-place; which is let into the wall that separates the middle apartment and the kitchen, and is so constructed as to communicate the heat to both rooms at the same time. There are two lofts over the kitchen and middle apartment, to which the inhabitants ascend by a ladder placed in the entry for that purpose. Each apartment has two small windows made of talc, and, among the inferior people, of fish-skin. The boards and beams of their habitations, are smoothed only with a hatchet, for they are strangers to the plane; and the smoke has rendered them of a deep shining black.

In Kamtschatka, an *ostrog* is called a town, and consists of several houses or habitations of the various kinds above-mentioned. *Balagans* are considerably the most numerous; and it is remarkable that we never saw a house of any kind that was detached from an *ostrog*. There are, in St. Peter and St. Paul, seven log-houses, nineteen *balagans*, and three *jourts*. *Paratounka* is nearly of the same size. *Karatchin* and *Natcheechin* have not so many log-houses as the former, but rather more *balagans* and *jourts*; whence it may be concluded that such is the most general size of an *ostrog*.

The dress of the Kamtschadale women having already been described, we shall proceed to that of the men. The upper garment resembles that of a waggoner's frock. If for summer wear, it is made of nankeen; if intended for winter, it is made of a skin, (generally that of a deer or dog) having one side tanned, and the hair preserved on the other, which is worn innermost. A close jacket of nankeen, or some other cotton stuff, is the next under this; and beneath that, a shirt made of thin Persian silk, of a red, blue, or yellow colour. They wear also a pair of long breeches, or tight trowsers, of leather, reaching below the calf of the leg. They have likewise a pair of boots, made of dog or deer skin, with the hair innermost. They have a fur cap, having two flaps that are usually tied up close to the head, but are permitted to fall round the shoulders in bad weather. The fur dress, which was presented by Major Behm's son to Captain King, is one of those worn on ceremonious occasions by the *Toions*. It is shaped like the exterior garment we have just described, and consists of small triangular pieces of fur, chequered brown and white, and so ingeniously joined as to appear to be of the same skin. A border, of the breadth of six inches, curiously wrought with different coloured threads of leather, surrounds the bottom, and produces a rich effect. A broad edging of the sea-otter's skin is suspended to this. The sleeves are ornamented with the same materials. An edging of it also encircles the neck, and surrounds the opening at the breast. It is lined with a beautiful white skin. And the present was accompanied with a pair of gloves, a cap, and a pair of boots, executed with the utmost neatness, and composed of the same materials. The Russians who reside in Kamtschatka, wear the European dress; and the uniform worn by the troops here, is of a dark green turned up with red.

THE people situated to the N. and S. of Kamtschatka, being but imperfectly known, we shall, before we proceed to the continuation of our voyage, give such information as we have been able to acquire respecting the Kurile Islands, the Koreki, and Tschutski. The Kuriles are a chain of islands, extending from the southern promontory of Kamtschatka to Japan, in a S. W. direction. The inhabitants of the neighbourhood of Lopatka, who were called Kuriles, gave these islands the same name, as soon as they became acquainted with them. Spanberg makes their number amount to 22, exclusive of the very small ones. The northernmost island is called Shoomska, and lies about three leagues distant from the promontory of Lopatka, its inhabitants consisting of a mixture of natives and Kamtschadales. The next, named Paramousir, is considerably larger than Shoomska, and is inhabited by the real natives, whose ancestors, they say, came from an island called Onecutan, a little farther to the S. The Russians paid their first visit to these two islands in 1713, and added them to the dominions of the Empress. The others, as far as Oosheheer inclusive, are now made tributary, if we may rely upon the information of the worthy pastor of Paratounca, their missionary; who pays them a visit once in three years, and mentions the islanders in the most respectable terms, extolling them for their hospitality and humanity; and that they excel their Kamtschadale neighbours as much in the gracefulness of their persons, as in their docility and understanding. Though the island of Oosheheer is the farthest to the S. of any under the dominion of Russia, yet they are said to trade to Ooroop, which is the 18th in order; and is the only one that has a good harbour for vessels of burthen. Nadeegida lies to the S. of this, and is said to be inhabited by a race of men who are remarkably hairy, and who live in a state of perfect independence, like those of Ooroop. Nearly in the same direction lie a group of islands called Jeezo, by the Japanese; a name also given by them to the chain of islands between Kamtschatka and Japan. That called Matmai, the farthest to the S. belongs to the Japanese, and has a garrison and fortifications on the side towards the continent. The islanders of Kunachir, and Zellany, to the N. E. of Matmai, and three others, called the Three Sisters, still farther to the N. E. are entirely independent. The inhabitants of Matmai barter with those of the islands last-mentioned, as well as with those of the Kuriles to the northward. Many of the inhabitants of those islands that are under the dominion of Russia, are now converted to Christianity. And perhaps the time is not far distant, when an advantageous commerce will be carried on between Kamtschatka and this extensive chain of islands, which may afterwards produce a communication with Japan itself. The advantages that must infallibly accrue to the Russians by establishing a commerce with the Japanese are sufficiently obvious.

In the country of Koreki are two distinct nations, called the wandering and fixed Koriacs. Part of the isthmus of Kamtschatka is inhabited by the former, as well as all the coast of the eastern ocean, from thence to the Anadir. The nation of the wandering Koriacs, extends westward towards the river Kovyma, and along the N. E. of the sea of Okotik, as far as the river Penskina. The resemblance between the fixed Koriacs, and the Kamtschadales, is very striking: both countries de-

pend alike on fishing for subsistence. Their cloathing and habitations are equally similar. The fixed Koriacs are under the district of Ingiga, and are tributary to Russia. The wandering Koriacs are employed wholly in breeding and pasturing deer, and are said to have immense numbers in their possession; it being common for a single chief to have a herd of 5,000. Upon the flesh of these animals they subsist, having an aversion to every kind of fish. They erect no Balagans; their only habitations being somewhat like the Kamtschadale jouts, except that, in winter, they are covered with raw deer-skins, and, in summer, with such as have been tanned. Their sledges are drawn only by deer, and those that are used in drawing them feed in the same pasture with the others. When they are wanted, the herdsman makes use of a certain cry, which, being very familiar to them, they obey, and quit the herd immediately. The two nations of the Koriacs, and the Tschutski, make use of different dialects of the same language; but it has not the smallest affinity to that of the Kamtschadale. The Tschutski are a courageous, well made, warlike race of people; and are formidable neighbours to the Koriacs of both nations, who often experience their depredations. The country inhabited by the Tschutski, is bounded by the Anadir on the S. and extends to the Tschutskoi Nofs. Their attention, like that of the wandering Koriacs, is confined chiefly to their deer, with which their country abounds. The Russians have long endeavoured to bring them under their dominion; but, though they have lost a great number of men in different expeditions, they have not yet been able to accomplish this purpose. It is now time to return to the history of our voyage, and to make known the plan of our future operations.

In the instructions for the regulation of the present voyage, the Lords of the Admiralty had intrusted the Commanding Officer of the expedition with a discretionary power, in case of not succeeding in the discovery of a passage from the Pacific Ocean into the Atlantic, to make choice, in his return to England, of whatever route he should judge proper; the Commodore therefore desired, that the principal officers would deliver their sentiments, in writing, relative to the mode in which these instructions might most effectually be carried into execution. The result of their opinions, which, to his great satisfaction, he found unanimous, and perfectly agreeing with his own, was, that the condition of the ships, their sails, cordage, &c. rendered it hazardous and unsafe to make any attempt, as the winter was now approaching, to navigate the sea between Asia and Japan, which would otherwise have opened to us the most copious field for discovery; that it was therefore most prudent to steer to the eastward of that island, and in our way thither, to sail along the Kuriles, and examine particularly those islands that are situated nearest to the northern coast of Japan, which are said to be of considerable extent, and not subject to the Russians or Japanese. Should we have the good fortune to meet with some secure and commodious harbours in any of these islands, we supposed they might prove of considerable importance, as convenient places of shelter for subsequent navigators, who might be employed in exploring the seas, or as the means of producing a commercial intercourse among the adjacent dominions of the two above-mentioned empires. Our

next

next object was to take a survey of the Japanese Isles; after which we designed to make the coast of China, as far to the N. as might be in our power, and then to proceed to Macao. This plan being adopted, Captain King received orders, in case the two ships should separate, to repair, without delay, to Macao.

On Saturday, the 9th of October, at six o'clock, P. M. having cleared the entrance of the Bay of Awatska, we made sail to the S. E. At midnight we had a dead calm, which continued till noon of the following day. A breeze springing up from the W. about three o'clock, P. M. we steered to the S. along the coast. A head-land now opened with Cape Gavareea, in the direction of S. by W. situated nearly 20 miles beyond it. On Monday, the 11th, at noon, we observed in lat. 52 deg. 4 min. long. 158 deg. 31 min. Cape Gavareea bearing N. by W. one quarter W. and the southern extremity S. W. half W. We were now at the distance of 9 or 10 miles from the nearest part of the coast, and perceived the whole inland country covered with snow. A point of land towards the S. formed the northern side of a deep bay, distinguished by the name of Achachinskoi, to the southward of which, the land did not exhibit such a rugged and barren aspect, as was observable in that part of the country which we had before passed. On Tuesday, the 12th, at six o'clock P. M. we discerned, from the mast-head, Cape Lopatka, which is the most southern extreme of Kamtschatka. This, by accurate observations, we found to be in lat. 51 deg. and in the long. of 156 deg. 45 min. We perceived, to the N. W. of it, a very lofty mountain, whose summit was lost in the clouds. At the same instant, the first of the Kurile islands, named Shoonska, made its appearance, in the direction of W. half S. On Wednesday, the 13th, at day-break, we descried the second of the Kurile islands, named Paramousir, by the Russians, extending from W. half S. to N. W. by W. This land was exceedingly high, and almost covered with snow. The island is the largest of the Kuriles; and its southern extremity stands, according to our computation, in lat. 49 deg. 58 min. the northern extremity we place in lat. 50 deg. 46 min. long. 160 deg. W. of Cape Lopatka. During the two following days, the wind, blowing fresh from the W. obliged us to steer to the southward, and consequently prevented us from seeing any more of the Kuriles. On Saturday, the 16th, our lat. was 45 deg. 27 min. our long. deduced from many lunar observations taken the three preceding days, was 155 deg. 30 min. and the variation 4 deg. 30 min. E. In this situation, we were almost encompassed by the real or pretended discoveries of prior navigators; not one of which we were fortunate enough to meet with in our course. The wind having veered in the afternoon to the northward, we hauled round to the W. In the course of this day, we observed several albatrosses, fulmars, and numerous flocks of gulls: we also saw a number of fish, called gram-pusses by our sailors; but we were rather inclined to judge, from the appearance of those which passed close by our vessels, that they were the kasatka, or sword-fish. Sunday, the 17th, we observed in lat. 45 deg. 7 min. long. 154 deg. On the 19th, at two o'clock A. M. we hauled our wind, and stood to the southward till five, at which time a violent storm reduced us to our courses. Though from the unfavourable state of the weather, there was but little probability of our making the land, our attention was still anxiously directed to this object; and on the appearance of day-light, we ventured to steer W. by S. We proceeded on the same course till 10 o'clock, when the wind suddenly veered round to the S. W. attended with fair weather. Scarce had we availed ourselves of this, by letting out our reefs, and setting the top-sails, when it began to blow with such vehemence, that we were under the necessity of close reefing again; and, about noon, the wind shifting more to the W. we were prevented from continuing any longer on this tack: we therefore put about, and stood towards the S. We were now in lat. 44 deg. 12 min. long. 150 deg. 40 min. so that, after all our exertions, we had the mortification of finding ourselves, according to the Russian charts, upon the same meridian with Nadeegs-

No. 78.

da, which they represent as the most southerly of all the Kurile islands. Though the violent and adverse winds that we had met with for six days past, had deprived us of an opportunity of getting in with these islands, yet the course on which we had been obliged to proceed, did not prove altogether destitute of geographical advantages: for the group of islands, comprehending Zellany, Kunashir, and the Three Sisters, which, in the maps of M. D'Anville, are laid down in the track we had just crossed, are, by this means, demonstrably removed from that position; and thus an additional proof is obtained of their being situated to the W. where Captain Spanberg has placed them, between the longitudes of 142 and 147 deg. But this space being occupied, in the French charts, by Staten Island, and part of the supposed land of Jesso, the opinion of Muller becomes highly probable, that they are all the same lands; and, as we have no reason to call in question the accuracy of Spanberg, we have, in our general chart, reinstated Kunashir, Zellany, and the Three Sisters, in their proper situation, and have totally omitted the rest. When we consider the manner in which the Russians have multiplied the islands of the northern Archipelago, not only from the want of accuracy in ascertaining their real position, but likewise from the desire, natural to mankind, of propagating new discoveries, we shall not be surprized, that the same causes should produce similar effects. It is thus that the lands of Jesso, which appear, as well from the earliest traditions among the Russians, as from the accounts of the Japanese, to be no other than the Kurile Islands, have been imagined to be distinct from the latter. De Gama's land is next on record; and this was originally represented as being nearly the same in situation with those we have just mentioned; but it was afterwards removed, in order to make room for Staten's Island, and the Company's land; and as Jesso, and the most southerly of the Kuriles, had likewise possession of this space, that nothing might be lost, the former had a place provided for it westward, and the latter towards the E. As, according to the Russian charts, the isles of Kunashir and Zellany, were still to the S. we entertained some hopes of being able to make them, and, with this view, kept the head of the Resolution towards the W. as much as the wind would permit. On Wednesday, the 20th, at noon, we observed in lat. 43 deg. 47 min. long. 150 deg. 30 min. We were then standing to the W. by S. with a gentle breeze from the S. E. but about three o'clock P. M. the wind, shifting to the N. W. point, began to blow with such violence, that we were brought under our mizen stay-sail, and fore-sail. For the following 24 hours we had heavy rain, and vehement squalls; and as the wind continued to blow from the N. W. our attempts to make the land were rendered abortive; and we were at length obliged to relinquish all further thoughts of discovery to the northward of Japan. To this disappointment we submitted with the greater reluctance, as our curiosity had been considerably excited by the accounts that are given of the natives of these islands. On the 21st, in the afternoon, an accident befel our ship, the Resolution; for the leach-rope of her fore-top-sail gave way, and split the sail. This having frequently happened during the life of Captain Cook, he had, on such occasions, ordered the foot and leach-ropes of the top-sails to be taken out, and larger ones to be fixed in their room; and these likewise proving incapable of supporting the strain that was on them, gave him good reason to observe to us, that the just proportion of strength between the sail and those ropes, is extremely miscalculated in our service. On the 22d, in the morning, we let out the reefs of our top-sails, and carried more sail. At noon, we found ourselves to be in lat. 40 deg. 58 min. long. 148 deg. 17 min. variation of the needle 3 deg. E. This day some birds afforded us clear indications that we were not at any considerable distance from land: with this hope we steered to the W. N. W. in which direction were situated, at the distance of about 50 leagues, the southernmost islands, seen by Captain Spanberg, and said to be inhabited by hairy men. At eight o'clock, the following morning, a fresh breeze

7 Z

springing

springing up, with which we continued our course till the evening, when we had violent squally gales, accompanied with rain; and as we had, in the course of this day, passed some patches of green grass, and observed a number of small land birds, a flag, and many flocks of gulls, we did not think it consistent with prudence, having all these signs of the vicinity of land, to stand on for the whole night: about midnight therefore we tacked, and for the space of a few hours steered S. E.

Sunday, the 24th, we again bore away to the W. N. W. and carried a press of sail till seven o'clock, P. M. when the wind veered round to the N. and blew a fresh gale. At this time our lat. was 40 deg. 57 min. long. 145 deg. 20 min. This second disappointment in our attempts to get to the N. W. the tempestuous weather with which we had been harassed, and the small probability, at this season of the year, of its becoming more favourable to our designs, were the motives that now induced Captain Gore to abandon finally all further search for the islands situate to the northward of Japan, and to direct our course to the W. S. W. for the northern part of that island. On the 25th, at noon, we were in lat. 40 deg. 18 min. and in long. 144 deg. Flights of wild ducks were this day observed by us; a pigeon lighted upon our rigging; and many small birds, resembling linnets, flew about the ships, with a degree of vigour, that gave us reason to imagine they had not been long on the wing. We also passed a piece either of bamboo or sugar-cane, and several patches of long grass. These indications of our being at no great distance from land, determined us to try for foundings; but we could not reach the bottom with 90 fathoms of line. On the approach of evening, the wind gradually veered round to the S. with which we continued our course to the W. S. W. On Tuesday, the 26th, at day-break, we had the satisfaction of perceiving high-land towards the W. which proved to be Japan. At eight o'clock, it was at the distance of ten or twelve miles, and extended from S. by W. to N. W. A low flat cape, which apparently constituted the southern part of the entrance of a bay, bore N. W. three quarters W. Near the S. extremity, a hill of a conic figure appeared, bearing S. by W. three quarters W. To the N. of this hill, there seemed to be an inlet of very considerable depth, the northern side of whose entrance is formed by a low point of land; and, as well as we were enabled to judge by the assistance of our glasses, has a small island near it towards the S. Having stood on till nine o'clock, we had, by that time, approached within five or six miles of the land, which bore W. three quarters S. We now tacked, and stood off; but as the wind failed us, we had proceeded, at noon, to no greater distance than 3 leagues from the shore. This part of the coast extended from N. W. by N. to S. half E. and was principally bold and cliffy. The low cape above-mentioned, was about six leagues distant, bearing N. W. by W. and the northern point of the inlet was in the direction of S. three quarters W. Our lat. by observation, was 40 deg. 5 min. and our long. 142 deg. 28 min. The most northerly land in view, was supposed by us to be the northern extreme of Japan. It is somewhat lower than the other parts; and from the range of the elevated lands that were discerned over it from the mast-head, the coast manifestly appeared to trend to the westward. The northern point of the inlet was imagined by us to be Cape Nambu; and we conjectured, that the town, which Jansen calls Nabo, stood in a break of the high land, towards which the inlet apparently directed itself. The neighbouring country is of a moderate elevation, and has a double range of mountains. It is well furnished with wood, and exhibits a variety of pleasing hills and dales. We perceived the smoke arising from several villages or towns, and saw many houses in delightful and cultivated situations, at a small distance from the shore. While the calm continued, that we might lose no time, we put our fishing lines overboard, in ten fathoms water, but had no success. This being the only diversion which our present circumstances would permit us to enjoy, we very sensibly felt our disappointment;

and looked back with regret to the cod-banks of the difinal regions we had lately quitted, which had furnished us with so many salutary meals, and by the amusement they had afforded, given a variety to the tedious recurrence of astronomical observations, and the wearisome succession of calms and gales. At two o'clock, P. M. the wind blew fresh from the S. and, by four, had reduced us to close reefed top-sails, and obliged us to stand off to the south-eastward; in consequence of which course, and the gloominess of the weather, we soon lost sight of land. We kept on during the whole night, and till eight o'clock the following morning, when the wind shifting to the N. and becoming moderate, we made sail, and steered a W. S. W. course, towards the land, which, however, we did not make before three in the afternoon; at which time it was seen to extend from N. W. half W. to W. The most northerly extremity was a continuation of the elevated land, the southernmost we had observed the preceding day. The land to the westward, we conjectured to be the High Table Hill of Jansen. The coast, between the two extremes, was low, and could scarcely be perceived, except from the mast-head. We proceeded towards the coast till eight in the evening, when our distance from it was about 5 leagues, and having shortened sail for the night, we steered in a southerly direction, founding every four hours; but our depth of water was so great, that we did not find ground with 160 fathoms of line.

On Thursday, the 28th, at six o'clock A. M. we again saw land, 12 leagues to the southward of that we had seen the day before, and extended from W. by N. to W. S. W. At ten o'clock we saw more land in the same direction. At noon, the northern extremity of the land in view bore N. W. by N. and a peaked hill, over a steep head-land, was 15 or 16 miles distant, bearing W. by N. By observation, our lat. was 38 deg. 16 min. and our long. 142 deg. 9 min. During the remainder of the day, we continued our course to the S. W. and, at midnight, found our depth of water to be 70 fathoms, over a bottom of fine brown sand. We therefore hauled up towards the E. till the next morning, when we again had sight of land, eleven leagues to the S. of that we had seen the preceding day. The ground was low towards the sea, but gradually swelled into hills of a moderate elevation. At nine o'clock, the sky being overcast, and the wind veering to the S. we tacked and stood off to the E. Not long after, we observed a vessel, close in with the land, standing to the N. along the shore; and we also saw another in the offing, coming down on us before the wind. Objects belonging to a country so celebrated, and yet so imperfectly known, excited a general eagerness of curiosity; in consequence of which, every person on board came instantaneously upon deck to gaze at them. As the vessel to windward approached us, she hauled off to a greater distance from the shore; upon which being apprehensive of alarming those who were on board of her by the appearance of a pursuit, we brought to, and she failed a-head of us. We might have spoken to them; but Captain Gore perceiving, by their manœuvres, that they were highly terrified, was unwilling to increase their apprehensions; and, imagining that we should have many better opportunities of a communication with the Japanese, suffered them to retire without interruption. According to the most probable conjectures we were enabled to form, the vessel was of the burthen of 40 tons; and there seemed to be six men on board her. She had only one mast, whereon was hoisted a quadrangular sail, extended aloft by a yard, the braces of which worked forwards. Three pieces of black cloth came half way down the sail, at an equal distance from each other. The vessel was lower in the middle than at each end; and from her figure we supposed, that she could not sail otherwise than large. At noon, the wind blew fresh, accompanied with much rain. By three o'clock it had increased in so great a degree, that we were reduced to our courses. The sea, at the same time, ran as high as any of our people ever remember to have seen it. About eight o'clock, in the evening, the

the gale, without the smallest diminution of violence, shifted to the W. and by producing a sudden swell, in a direction contrary to that which had before prevailed, caused our ships to labour and strain exceedingly. During the storm, we had several of our sails split. They had, indeed, been bent for so long a time, and were worn so thin, that this accident had happened lately in both vessels almost daily; particularly when the sails were stiff, and heavy with rain, in which case they became less capable of bearing the shocks of the boisterous and variable winds we experienced occasionally. On Saturday, the 30th at noon, we observed in lat. 36 deg. 41 min. long. 142 deg. 6 min. In the afternoon, the wind shifting to the N. E. we stood to the S. at the distance of 18 leagues from the shore. On the 31st, at two o'clock A. M. the wind veered round to the W. and blew in violent squalls, accompanied with lightning and rain.

Monday, November the 1st, the wind shifted to the S. E. and was attended with fair weather; in consequence of which, we obtained, with four different quadrants, 42 sets of distances of the moon, from the sun and stars, each set comprehending six observations. These nearly coinciding with each other, we determined, at noon, by observation, our lat. to be 35 deg. 17 min. and our long. with great accuracy, to be 141 deg. 32 min. At two o'clock, we again made land towards the W. distant 13 leagues. A hummock to the northward, which had an insular appearance bore N. N. W. half W. We steered for the land till between five and six, when we hauled our wind to the S. At this time we descried to the westward a mountain of extraordinary height, with a round summit, rising far inland. In its neighbourhood the coast is of a moderate elevation; but, to the S. of the hummock island, there appeared at a considerable distance up the country, a ridge of hills, extending towards the mountain, and which might perhaps join it. As the weather, in the morning of the 2nd, had a very threatening appearance, and the wind was at S. S. E. we thought it advisable to quit the neighbourhood of the shore, and stand off towards the E. that the ships might not be entangled with the land. We were not deceived in our prognostications; for not long afterwards, a heavy gale began to blow, which continued till the next day, and was attended with rainy and hazy weather. On Wednesday the 3d, in the morning, we found ourselves by our reckoning, upwards of 50 leagues from the coast; which circumstance, united to the consideration of the very uncommon effect of currents we had already experienced, the advanced period of the year, the variable and uncertain state of the weather, and the small prospect we had of any alteration for the better, induced Captain Gore to form the resolution of leaving Japan, and prosecuting our voyage to China: to which facts may be added; that the coast of Japan, according to Kämpfer's description of it, is the most dangerous in all the known world; that it would have been exceedingly hazardous, in case of distress, to have run into any of the harbours of that country; where, if we may credit the most authentic writers, the aversion of the natives to a communication with strangers, has prompted them to the commission of the most flagrant acts of barbarity; that our vessels were in a leaky condition; that the rigging was so rotten as to require continual repairs; and that the sails were almost entirely worn out, and incapable of withstanding the vehemence of a gale of wind. As the violent currents, which set along the eastern coast of Japan, may perhaps be attended with dangerous consequences to those navigators, who are not acquainted with their extreme rapidity, we will here subjoin a summary account of their direction and force, as remarked by us from the 1st to the 8th of November. On the 1st, at the time when we were about 18 leagues to the E. of White Point, the current set at the rate of 3 miles in an hour, to the N. E. and by N. On the 2nd, as we made a nearer approach to the shore, we observed, that it continued in a similar direction, but was augmented in its rapidity to 5 miles an hour. As we receded from the coast, it again became more

moderate, and inclined towards the E. On the 3d, at the distance of 60 leagues from the shore, it set, at the rate of 3 miles an hour, to the E. N. E. On the two following days, it turned to the southward, and, at 120 leagues from the coast, its direction was S. E. and its rate did not exceed one mile and a half an hour. It again, on the 6th, and 7th, shifted to the N. E. and its force diminished gradually till the 8th, at which time we could not perceive any current.

During the 4th and 5th of November, we proceeded to the south-eastward, with very unsettled weather, having much lightening and rain. On Saturday, the 6th, we changed our course to the S. S. W. but about eight o'clock, in the evening, we were obliged to stand towards the S. E. On the 9th at noon, we observed in lat. 31 deg. 46 min. long. 146 deg. 20 min. Friday, the 12th, a most violent gale arose, which reduced us to the mizen-stay-sail and fore-sail. At noon, we were in lat. 27 deg. 36 min. and in long. 144 deg. 25 min. On the 13th, we were nearly in the same situation attributed to the island of St. Juan, yet we saw not the least appearance of land. At six o'clock, P. M. we steered to W. S. W. Captain Gore thinking it useless to stand any longer to the S. S. W. as we were nearly in the same meridian with the Ladrões, or Marianne Islands, and at no very considerable distance from the track of the Manila galleons. On Monday, the 15th, we saw three islands, and bore away for the S. point of the largest, upon which we observed a high barren hill, flattish at the top, and when seen from the W. S. W. presents an evident volcanic crater. The earth, rock, or sand, for it was not easy to distinguish of which its surface is composed, exhibited various colours, and a considerable part we conjectured to be sulphur, both from its appearance to the eye, and the strong sulphureous smell perceived by us in our approach to the point. The Resolution having passed nearer the land, several of our officers thought they discerned steams proceeding from the top of the hill. These circumstances induced the Commodore to bestow on this discovery, the name of Sulphur Island. On Friday, the 26th, at six o'clock A. M. the wind having considerably abated, we set our top-sails, let out the reefs, and bore away to the westward. At noon, we observed in lat. 21 deg. 12 min. long. 120 deg. 25 min. In the course of this day, we saw many tropic birds, and a flock of ducks; also porpoises and dolphins; and continued to pass many pumice stones. We spent the night on our tacks; and on the 27th, at six o'clock A. M. we again made sail to the W. in search of the Bashee Isles. On the 28th, at four o'clock, A. M. we had sight of the island of Prata. At noon, our lat. was 20 deg. 39 min. long. 116 deg. 45 min. The extent of the Prata shoal is considerable; for it is about 6 leagues from N. to S. and extends 4 leagues to the E. of the island: its limits to the westward, we had not an opportunity of ascertaining. We carried a press of sail during the remainder of the day, and kept the wind, which now blew from the N. E. by N. in order to secure our passage to Macao.

On Monday, the 29th, in the morning, we passed some Chinese fishing-boats, the crews of which eyed us with marks of great indifference. At noon, our lat. by observation, was 22 deg. 1 min. and, since the preceding noon, we had run 110 miles upon a N. W. course. On the 30th, in the morning, we ran along the Lema Isles, which, like the other islands situated on this coast, are destitute of wood, and, as far as we had an opportunity of observing, devoid of cultivation. We now fired a gun, and displayed our colours, as a signal for a pilot. On the repetition of the signal, there was an excellent race between four Chinese boats; and Captain Gore engaged with the person who arrived first, to conduct the ship to the Typa, for the sum of 30 dollars, sending word, at the same time to Captain King, that as he could easily follow with the Discovery, that expence might be saved to him. In a short time afterwards a second pilot got on board, and immediately laying hold of the wheel, began to order the sails to be trimmed. This gave rise to a violent altercation, which was at length

length compromised, by agreeing to divide the money between them. In obedience to the instructions from the Lords of the Admiralty, it now became necessary to demand of the officers and men, belonging to both ships, their journals, and what other papers they might have in their possession, relative to the history of the voyage. At the same time Captain King gave the Discovery's people to understand, that whatever papers they wished should not be sent to the Lords of the Admiralty, he would seal up in their presence, and preserve in his custody till the intentions of their Lordships, respecting the publication of the history of the voyage, were accomplished, after which, he said they should be faithfully restored to them. The Captain observes upon this occasion, that it is but doing justice to his company to declare, that, as to the crew, they were the best disposed, and the most obedient men he ever knew, though the greatest part of them were very young, and had never served before in a ship of war. The same proposals were made to the people of the Resolution, and instantly complied with.

We continued working to windward, by the direction of our pilot, till about six o'clock P. M. when we let go our anchors, he being of opinion, that the tide was now setting against us. During the afternoon, we stood on our tacks, between the Grand Ladrone and the island of Potoe, having passed to the east of the latter. At nine o'clock we again cast anchor in six fathoms water; the town of Macao being at the distance of 9 or 10 miles, in a N. W. direction; and the island of Potoe bearing S. half W. seven miles distant.

On the 2d of December, in the morning, one of the Chinese contractors, called Compradors, came on board, and sold us as much beef as weighed 200 weight, together with a considerable quantity of greens, oranges, and eggs. In the evening Captain Gore sent Mr. King on shore to visit the Portuguese Governor, and to request his assistance in procuring refreshments, which he thought might be done on more reasonable terms than the Comprador would undertake to furnish them; with whom we had agreed for a daily supply; for which, however, he insisted on our paying him before-hand. Upon Mr. King's arrival at the citadel, the Fort-Major informed him that the governor was sick, and not able to see company. Having acquainted the Major with his desire of proceeding immediately to Canton, the former told him, that they could not presume to provide a boat, till permission had been obtained from the Hoppo, or officer of the customs; and that it was necessary to apply, for this purpose, to the Chinese government at Canton. When the Captain was returning, the Portuguese officer asked him, if he did not mean to visit the English gentlemen at Macao? This question gave him inexpressible pleasure. He proceeded immediately to the house of one of his countrymen; from whom he received information of the French war, and of the continuance of the American war; and that five sail of English ships were now at Wampu, near Canton, in China. The intelligence we had gained concerning the state of affairs in Europe, rendered us the more anxious to accelerate our departure as much as we possibly could. The first thing that claimed the attention of the Commodore, was to provide as well as he could for the general safety of the people under his command, on their return home. The news of a French war, without letting us know the order issued by the King of France in our favour, gave us much concern. Our ships were ill fitted for war: the decks, fore and aft, being finished flush, had no covering for men or officers; it was therefore thought necessary to raise a kind of parapet, musquet-proof, on both decks; and likewise to strengthen the cabins as much as possible in case of action. On Thursday, the 9th, we received an answer from the English supercargoes at Canton, in which they promised to exert their most strenuous endeavours in procuring the supplies of which we were in want, with all possible dispatch; and that a passport should be sent for one of our officers. Friday, the 10th, an English merchant, from one of our East-Indian settlements, made application to Captain Gore for the assist-

ance of a few of his people, to navigate as far as Canton a vessel which he had purchased at Macao. The Commodore considering this as a good opportunity for Captain King to repair to that city, gave orders, that he should take with him his second lieutenant, the lieutenant of the marines, and 10 sailors. Accordingly, they quitted the harbour of Macao, on Saturday, the 11th; and as they approached the Bocca Tygris, which is near 40 miles distant from Macao, the coast of China appeared to the eastward in white steep cliffs. Their progress being retarded by contrary winds, and the lightness of the vessel, they did not arrive at Wampu, which is only nine leagues from the Bocca Tygris, till Saturday, the 18th. Wampu is a small town, off which the ships of various nations, who trade with the Chinese, are stationed, in order to receive their respective ladings. At Wampu, Captain King embarked in a Sampane, or Chinese boat, the most convenient for passengers that we ever saw; and in the evening we reached Canton, and disembarked at the English Factory, where the Captain was received with every mark of civility and respect. Messrs. Fitzhugh, Bevan, and Rapier, composed, at this time, the Select Committee; and the former of these gentlemen acted as president. They immediately gave the Captain an inventory of those stores with which the East-India ships were able to supply us, and he had the pleasure to find, that they were ready to be shipped, and that the provisions we might have occasion for might be had at a day's notice. Being desirous of making our stay here as short as possible, the Captain requested, that the gentlemen would endeavour to procure junks for us the next day; but we were soon convinced by them, that patience is an indispensable virtue in China. After the Captain had waited several days for the issue of his negociation with the Chinese, and was considering what steps he should take, the commander of a country ship presented him with a letter from Captain Gore, whereby he was informed of that Commander being engaged to bring our party from Canton, and to deliver our supplies, at his own hazard, in the Tyta. All difficulties being thus removed, Captain King had leisure to bestow some attention on the purchase of our stores and provisions, which he completed on Sunday, the 26th, and, on the following day, the whole stock was conveyed on board. As Canton was likely to be the most advantageous market for furs, the Commodore had desired Captain King to take with him about 20 skins of sea-otters; most of which had been the property of our deceased Commanders; and to dispose of them at the best price he could obtain. The English supercargoes being informed of these circumstances, they directed him to a member of the Hong (a society of the principal merchants of the city) who being fully apprised of the nature of the business, seemed to be sensible of the delicacy of the Captain's situation, and therefore assured him, that, in an affair of this kind, he should consider himself as a mere agent, without seeking any profit for himself. The skins being laid before this merchant, he examined them over and over again with particular attention; and at last informed Captain King, that he could not think of offering more than 300 dollars for them. As the Captain knew he had not offered one half of their value, he, therefore, in his turn, demanded 1000 dollars; the Chinese merchant then advanced to five, and, at length to 700 dollars; upon which the Captain lowered his demands to 900. Here, each of them declaring that he would not recede, they parted; but the Chinese speedily returned, and proposed finally, that they should divide the difference, which the Captain agreed to, and received 800 dollars. The subsequent remarks, relative to Canton, were collected by Captain King, from the intelligence which he received from several English gentlemen, who had resided a long time near that city.

Canton, containing the old and new town, with the suburbs, is about 10 miles in circumference. The number of its inhabitants, as near as can be computed, may be from 100 to 150,000. Exclusive of whom there are 40,000 who reside constantly in Borges, called Sampa-

res, or floating-houses upon the river. They are moored in rows close to each other, with a narrow passage, at intervals, for the boats to pass up and down the river.

The streets of this city are long, narrow, and destitute of uniformity. They are well paved with large stones, and, in general, kept extremely clean. The houses are built of brick, and are only one story high. They have, for the most part, two or three courts backwards, in which are erected the warehouses for the reception of merchandize; and, in the houses within the city, are the apartments for the females. Some of the meaner sort of people, though very few, have their habitations composed of wood.

Those that belong to the European factors, are built on a fine quay, having a regular facade of two stories towards the river. They are constructed, with respect to the inside, partly after the Chinese, and partly after the European mode. Adjoining to them are a considerable number of houses which belong to the Chinese; and are let out by them to the commanders of vessels, and to merchants, who make only an occasional stay. As no European is permitted to take his wife with him to Canton, the English supercargoes live together at one common table, which is maintained by the Company, and each of them has also an apartment appropriated to himself, consisting of three or four rooms. The period of their residence rarely exceeds eight months in a year; and as, during that time, they are almost constantly employed in the service of the Company, they may submit, with the less uneasiness, to the restrictions under which they live. They seldom make any visits within the walls of Canton, except on public occasions. Nothing contributed more to give Captain King an unfavourable opinion of the Chinese, than his finding that several of them who had resided in that country for near 15 successive years, had never formed any social connection or friendship. When the last ship departs from Wampou, they are all under the necessity of retiring to Macao; but they leave behind them all the money they possess in specie, which, Mr. King was informed, sometimes amounts to 100,000*l.* sterling, and for which they have no other security than the seals of the Viceroy, the Mandarines, and the merchants of the Hong: a striking proof of the excellent police maintained in China.

During our continuance at Canton, Mr. King accompanied one of the English gentlemen on a visit to a person of the first distinction in the place. They were received in a long room or gallery, at the further end of which a table was placed, with a large chair behind it, and a row of chairs extending from it, on both sides, down the room. The captain having been previously instructed, that the point of politeness consisted in remaining unseated as long as possible, readily submitted to this piece of etiquette; after which he and his friend were treated with tea, and some fresh and preserved fruits. Their entertainer was very corpulent, had a dull heavy countenance, and displayed great gravity in his deportment. He had learned to speak a little broken English and Portuguese. After his two guests had taken their refreshment, he conducted them about his house and garden; and when he had shewn them all the improvements he was making, they took their leave.

The Captain being desirous of avoiding the trouble and delay that might attend an application for passports, as well as of saving the unnecessary expence of hiring a sampan, which he was informed amounted at least to 12 pounds sterling, had hitherto designed to go along with the supplies to Macao, in the country merchant's ship we mentioned before: but receiving an invitation from two English gentlemen, who had found means to procure passports for four, he accepted, together with Mr. Phillips, their offer of places in a Chinese boat, and intrusted Mr. Lannyon with the superintendence of the men and stores, which were to sail the following day.

On Sunday, the 26th, in the evening, Captain King took his leave of the supercargoes, after having returned them thanks for their many favours; among which must be mentioned a present of a considerable quantity of

No. 79.

tea, for the use of the companies of both ships, and a copious collection of English periodical publications. The latter proved a valuable acquisition to us, as they not only served to beguile our impatience, in the prosecution of our tedious voyage homewards, but also enabled us to return not wholly unacquainted with what had been transacting in our native country during our absence. On the 27th, at one o'clock in the morning, Messrs. King and Phillips, and the two English gentlemen, quitted Canton, and, about the same hour of the succeeding day, arrived at Macao, having passed down a channel situated to the west of that by which we had come up.

In the absence of our party from Macao, a brisk traffic had been carrying on with the Chinese for our sea-otter-skins, the value of which had augmented every day. One of our sailors disposed of his stock, alone, for 800 dollars; and a few of the best skins, which were clean, and had been carefully preserved, produced 120 dollars each. The total amount of the value, in goods and cash, that was obtained for the furs of both our vessels, we are confident was not less than 2,000*l.* sterling; and it was the general opinion, that at least two-thirds of the quantity we had originally procured from the Americans, were by this time spoiled and worn out, or had been bestowed as presents, and otherwise disposed of in Kamtschatka. If, in addition to these facts, we consider, that we at first collected the furs without having just ideas of their real value; that most of them had been worn by the savages from whom we purchased them; that little regard was afterwards shewn to their preservation; that they were frequently made use of as bed-clothes, and likewise for other purposes, during our cruise to the northward; and that, in all probability, we never received the full value for them in China; the benefits that might accrue from a voyage to that part of the American coast where we obtained them, undertaken with commercial views, will certainly appear of sufficient importance to claim the public attention. So great was the rage with which our seamen were possessed to return to Cook's River, and there procure another cargo of skins, by which they might be enabled to make their fortunes, that, at one time, they were almost on the point of proceeding to a mutiny. And Captain King acknowledges, that he could not refrain from indulging himself in a project, which was first suggested to him by the disappointment we had met with in being compelled to leave the Japanese Archipelago, as well as the northern coast of China, unexplored; and he is of opinion, that this object may still be happily attained, by means of our East-India Company, not only with trifling expence, but even with the prospect of very beneficial consequences. The state of affairs at home, or perhaps greater difficulties in the accomplishment of his plan than he had foreseen, have hitherto prevented its being carried into execution; but, as the scheme seems to be well contrived, the reader will not be displeased with our inserting it here.

In the first place, Captain King proposes, that the East-India Company's China ships should, each, carry an additional number of men, making 100 in the whole. Two vessels, one of 200 tons, and the other of 150, might, with proper notice, (as Mr. King was informed) be purchased at Canton; and, as victualling is as cheap there as in Europe, he has calculated that they might be completely equipped for sea, with one year's provisions and pay, for the sum of 6,000*l.* including the purchase. The expence of the requisite articles for barter is very inconsiderable.

Captain King particularly recommends that each of the ships should have a forge, five tons of unwrought iron, and a skilful smith, with an apprentice and journeyman, who might occasionally make such tools, as the Indians should appear to have the greatest inclination for possessing. For, though half a dozen of the finest skins, obtained by us, were purchased with woods, large green glass beads, yet it is very common in a proa, fancy of these people, for ornamenting the upper-end of the harpoon with a person of decent appearance.

8 A

nimself to Captain Gore, with an ease

commodity for their market is iron. To this might be added several bales of coarse woollen cloth, two or three barrels of glass and copper trinkets, and a few gross of large pointed case-knives. He then proposes, that two vessels, not only for the greater security of the voyage, but because single ships ought never, in his opinion, to be sent out for the purpose of discovery. For where risks are frequently to be run, and uncertain and dangerous experiments tried, it can by no means be expected that single ships should venture so far, as where some security is provided against an unfortunate accident. When the ships are prepared for sea, they will sail with the first S. W. monsoon, which usually sets in about the commencement of the month of April. They will steer a northward course, with this wind, along the Chinese coast, beginning to make a more accurate survey from the mouth of the Nankin river, or the river Kyana, in the 30th degree of latitude, which is supposed to be the remotest limit of this coast hitherto visited by European vessels. The extent of the great gulph called Whang Hay, or the Yellow Sea, being at present unknown, it may be left to the Commander's discretion, to proceed up it as far as he may think proper: he must be cautious, however, not to entangle himself in it too far, lest he should not have sufficient time left for the prosecution of the remainder of his voyage. The same discretion may be used, when he has reached the straits of Tessoï, with regard to the islands of Jesso, which, if the wind and weather should be favourable, he must not neglect to explore. Having arrived in the latitude of 51 deg 40 min. where he will make the most southerly point of the isle of Sagaleen, beyond which we have a considerable knowledge of the sea of Okotsk, he will steer towards the S. probably about the beginning of June, and exert his endeavours to fall in with the most southern of the Kurile islands. If the accounts of the Russians may be depended on, Oorooop, or Nadeschda, will furnish the ships with a commodious harbour, where they may recruit their wood and water, and provide themselves with such refreshments as the place may afford. Near the end of June the commander will direct his course to the Shom-magins, whence he will proceed to Cook's River, purchasing, in his progress, as many skins as possible, without losing too much time, since he ought to sail again to the southward, and trace the coast with the utmost accuracy between the 56th and 50th degrees of latitude, the space where contrary winds drove us out of sight of land. We think it proper to observe here, that Captain King considers the purchase of skins, in this expedition, as a secondary concern, for defraying the expence; and, from our experience in the present voyage, there is no reason to doubt that 250 skins, each worth 100 dollars, may be obtained without loss of time; particularly as they will, in all probability, be met with along the coast to the S. of Cook's River.

The commander of this expedition, after having continued about three months on the American coast, will set out on his return to China in the former part of October, taking care, in his route, to avoid, as much as possible, the tracks of preceding navigators. All that remains to be added on this subject, is, that if the fur trade should become an established object of Indian commerce, many opportunities will occur of completing whatever may have been left unfinished, in the voyage of which the outlines are here delineated.

During our absence, a very ludicrous alteration took place in the dress of all our crew, in consequence of the barter which the Chinese had carried on with us for our sea-otter skins. On our arrival in the Typa, not only the sailors, but likewise the younger officers, were ex-

tremely ragged in their apparel; for, as the voyage had now exceeded, almost by a year, the time it was at first supposed we should continue at sea, the far greater part of our original stock of European clothes had been long ago worn out, or repaired and patched up with skins, and the different manufactures we had met with in the course of the expedition. These were now mixed and eked out with the gayest silks and cottons that China could produce.

On the 30th, being Friday, Mr. Lannyon arrived with the stores and provisions, which, without delay, were stowed in due proportion on board both the ships. While in the Typa, Captain King was shewn, in the garden of an English gentleman, at Macao, the rock, under which, according to traditional accounts, Camoens, the celebrated Portuguese poet, was accustomed to sit and compose his *Lusiad*. It is an arch of considerable height, consisting of one solid stone, and forming the entrance of a grotto dug out of the elevated ground behind it. Large spreading trees overshadow the rock, which commands a beautiful and extensive prospect of the sea, and the islands dispersed about it. During our continuance in the Typa, we heard nothing with respect to the measurement of the ships; we may therefore reasonably conclude, that the point so strongly contested, in Commodore Anson's time, by the Chinese, has, in consequence of his firmness and resolution, never since been insisted on. By the observations made while our vessels lay here, the harbour of Macao is situated in the lat. of 22 deg. 12 min. N. and the long. of 113 deg. 47 min. E. our anchoring place, in the Typa, in lat. 22 deg. 9 min. 20 sec. long. 113 deg. 48 min. 34 sec. E. It was high water in the Typa, on the full and change days, at a quarter after five o'clock; and in the harbour of Macao, at 50 minutes past five: the greatest rise was six feet one inch. We shall conclude these remarks, and this chapter, with the prices of labour, and a few articles of provisions in China.

PRICES OF LABOUR AND PROVISIONS at CANTON.

	£.	S.	D.	
A Coolee, or Porter	-	-	-	8 Per Day
A Taylor	-	-	-	5 and rice
A Handicraftsman	-	-	-	8 ditto
A common Labourer from 3d. to 5d. per day.				
A Woman's labour considerably cheaper.				
	£.	S.	D.	
Butter	-	0	2	4½ Per Catty
Beef	-	0	0	2½ or 18 oz.
Calf	-	1	6	9½ each
Ducks	-	0	0	5½ Per Catty
Ditto, wild	-	0	1	0½ each
Eggs	-	0	2	0 Per 100
Frogs	-	0	0	6½ Per Catty
Fowls, Capons, &c.	-	0	0	7½ ditto
Geese	-	0	0	6½ ditto
Ham	-	0	1	2½ ditto
Hog, alive	-	0	0	4½ ditto
Kid, ditto	-	0	0	4½ ditto
Milk	-	0	0	1½ ditto
Pork	-	0	0	7½ ditto
Pig	-	0	0	5½ ditto
Pheasants	-	0	5	4 each
Partridges	-	0	0	9½ ditto
Pigeons	-	0	0	5½ ditto
Rabbits	-	0	1	4 ditto
Sheep	-	3	6	8 ditto
Spices	-	0	0	16 8 Per Catty
Soy	-	0	0	1½ ditto
Samsui ditto	-	0	0	2½ ditto
Turtle	-	0	0	9½ ditto

ease and politeness which indicated that he had been accustomed to pass his time in other company than what Condore afforded. He brought with him a sort of certificate, written in the French language, of which the following is a translation.

"Peter George, Bishop of Adran, Apostolic Vicar of Cochinchina, &c. The little Mandarin, who is the bearer hereof, is the real Envoy of the Court to Pulo Condore, to attend there for the reception of all European vessels, whose destination is to approach that place, &c. A Sai-Gon, 10 August, 1779."

He gave us to understand, that he was the Mandarin mentioned in it; and produced another paper, which was a letter sealed up, and addressed to the Captains of any European ships that may touch at Condore. From this letter, and the whole of Luco's conversation, the Mandarin, we had little doubt, that the vessel he expected was a French one. We found, at the same time, that he was desirous of not losing his errand, and was not unwilling to become our pilot. We could not discover from him the precise business which the ship he was waiting for designed to prosecute in Cochinchina. We shall only add, that he acquainted us, that the French vessels might perhaps have touched at Tinnon, and from thence sail to Cochinchina; and as no intelligence had been received, he imagined that this was most likely to have been the case. Captain Gore afterwards enquired, what supplies could be procured from this island. Luco replied, he had two buffaloes belonging to him, which were at our service, and that considerable numbers of those animals might be purchased for four or five dollars each: We had purchased eight of these animals; and on the 23d, early in the morning, the launches of both ships were dispatched to the town to bring them away, but our people were much at a loss to bring them on board. After consulting with the Mandarin, it was determined, that they should be driven through the wood, and over the hill, down to the bay, where our two Captains had landed. This plan was accordingly executed; but the untractableness, and amazing strength of the animals rendered it a slow and difficult operation. The mode of conducting them was, by putting ropes through their nostrils, and round their horns; but when they were once enraged at the sight of our people, they became so furious, that they sometimes tore asunder the cartilage of the nostril, through which the ropes passed, and set themselves at liberty; at other times they broke the trees, to which it was found necessary to fasten them. On such occasions, all the endeavours of our men, for the recovery of them, would have been unsuccessful, without the aid of some little boys, whom the buffaloes would suffer to approach, and by whose puerile managements their rage was quickly appeased; and when brought down to the beach, it was by their assistance, in twisting ropes about their legs, in the manner they were directed, that our people were enabled to throw them down, and, by that means, to get them into the boats; and, a circumstance very singular, they had not been a whole day on board, before they were as tame as possible. Captain King kept a male and a female for a considerable time, which became great favourites with the seamen. Thinking a breed of these animals, some of which weighed, when dressed, 700 pounds, would be an acquisition of some value, he intended to have brought them with him to England; but that design was frustrated by an incurable hurt which one of them received at sea. Besides the buffaloes, of which there are several large herds in this island, we purchased from the natives some remarkably fine fat hogs, of the Chinese breed. We procured three or four of the wild fow; several of whose tracks were seen in the woods; which also abound with monkeys and squirrels, but so shy, that it was difficult to shoot them. Here we found the cabbage-tree, and other succulent greens, with which our people made very free without asking questions. Two wells of excellent water had been discovered, in consequence of which part of the companies of both ships had been employed in providing a competent supply of it. Our numerous subscribers will

be pleased to recollect, that in our history of Captain Cook's first and second voyages, we have given a concise, though comprehensive account of Pulo Condore, Celebes, Sumatra, Java, the Philippine, Ladrões, and, in short, all the principal islands in the Indian Sea; it therefore only now remains, during the remainder of our passage home, with a view of establishing the credit and reputation of this work, and of rendering it the most complete undertaking of the kind extant, to mention a few particulars that came under our own observation, and which may be reckoned as improvements since the labours of former compilers, or the expeditions of prior navigators.

Pulo Condore signifies the island of Calabashes, its name being derived from two Malay words, Pulo, implying an island, and Condore, a Calabash, great quantities of which fruit are produced here. Among the vegetable improvements of this island, may be reckoned the fields of rice that we observed; also cocoa-nuts, pomegranates, oranges, shaddocks, and various sorts of pompons. We continued at this harbour till the 28th, when the little Mandarin took leave of us; at which time the Commodore gave him, at his request, a letter of recommendation to the Commanders of any other vessels that might put in here. He also bestowed on him a handsome present, and gave him a letter for the bishop of Adrian, together with a telescope, which he desired might be presented to him as a compliment for the favours we had received, through his means, at Pulo Condore. The latitude of the harbour is 8 deg. 40 min. N. and its longitude, deduced from many lunar observations, 106 deg. 18 min. 46 sec. E. At full and change of the moon it was high water at 4 h. 15 m. apparent time; after which the water continued for 12 hours, without any perceptible alteration. The transition from ebbing to flowing was very quick, being in less than five minutes. The water rose and fell seven feet four inches perpendicular.

On Friday, the 28th, we unmoored, and cleared the harbour. On the 30th, at one o'clock, P. M. we had sight of Pulo Timooan, and at five, Pulo Puissang was seen in the direction of S. by E. three quarters E. At nine o'clock, we had, from the effect of some current, out-run our reckoning, and found ourselves close upon Pulo Aor, in the lat. of 2 deg. 46 min N. long. 104 deg. 37 min. E. in consequence of which we hauled the wind to the E. S. E. This course we prosecuted till midnight, and then steered S. S. E. for the straits of Banca.

On Tuesday, the 1st of February, we observed in lat. 1 deg. 20 min. N. and our long. by a number of lunar observations, we found to be 105 deg. E. Towards sun-set, we had a view of Pulo Panjang; at which time our lat. was 53 min. N. On the 2d, we passed the straits of Sunda; and, at noon, we came in sight of the small islands known by the name of Dominis, lying off the eastern part of Lingin. At one o'clock, P. M. Pulo Taya made its appearance in the direction of S. W. by W. distant 7 leagues. On the 3d, at day-break, we had sight of the three islands; and, not long afterwards, saw Monopin Hill, in the island of Banca. Having got to the W. of the shoal, named Frederic Endric, we entered the straits of Banca, and bore away towards the S. On the 4th, in the morning, we proceeded down the straits with the tide; and, at noon, the tide beginning to make against us, we cast anchor, at the distance of about one league from what is denominated the Third Point, on the Sumatra shore; Monopin Hill bearing N. 54 deg. W. and our lat. being 2 deg. 22 min. S. long. 105 deg. 38 min. E. At three in the afternoon we weighed, and continued our course through the straits with a gentle breeze. In passing these straits, ships may make a nearer approach to the coast of Sumatra than to that of Banca. On Sunday, the 6th, in the morning, we passed to the W. of Lufepara; and at five o'clock, P. M. we descried the Sisters, in the direction of S. by W. half W. At seven we cast anchor three leagues to the northward of those islands. On the 7th, at five o'clock, A. M. we weighed, and in three hours afterwards we were in sight of the Sisters. These are two islands of very small extent, plentifully stocked with wood, and situated in 50 deg.

Two mariners belonging to the Resolution make off with the six-oared cutter—Defensible state of the two ships—They unmoor and leave the Typa—Orders of the French Court relative to Captain Cook—Pass Pulo Sapatra, and anchor in the harbour of Pulo Condore—Transactions, and incidents during our stay—A mandarine visits the ships—Information received from him—Reference for the description of Pulo Condore, and other islands to the first and second Histories of Captain Cook's Voyages—Presents to the Mandarin, and the bishop of Adran—Astronomical and nautical observations—Departure of the Resolution and Discovery from Pulo Condore—Enter the straits of Banca—Description of the country that borders thereon—Enter the straits of Sunda—Mr. Williamson sent on board a Dutch ship to procure intelligence—The two ships anchor at Cracatoa—That island described—Proceed to Princes Island—Unhealthy effects of the climate of Java—A sudden storm—Steer for the Cape of Good Hope—Anchor in Simon's Bay—A visit to the governor—An account of False Bay, Simon's Bay, Noah's Ark, and Seal Island—Set sail for England; and stand to the west of the islands of Ascension and St. Helena—Descry the western coast of Ireland, and endeavour, in vain, to get into Port Galway—Steer to the north of Lewis Island—Both ships anchor at Stromness—And on Wednesday, the 4th of October, arrive safe at the Nore, after an absence of 4 years, 2 months, and 22 days—Concluding remarks.

A. D. 1780. **O**N Tuesday, the 11th of January, two sailors, John Cave quartermaster, and Robert Spencer belonging to the Resolution, went off with a six-oared cutter; and though the most diligent search was made, both this and the following morning, we could not gain any intelligence of them. It was imagined, that these seamen had been seduced by the hopes of acquiring a fortune, if they should return to the fur islands. On the 12th, at noon, we unmoored, and scaled the guns, which, on board the Discovery, amounted at this time to ten; so that her people by means of four additional ports, could fight seven on a side. In the Resolution likewise, the number of guns had been augmented from 12 to 16; and, in each of the ships, all other precautions were taken to give our inconsiderable force a respectable appearance. We considered it as our duty to furnish ourselves with these means of defence, though there was some reason to believe, that they had in a great measure been rendered superfluous by the generosity of our enemies; for we were informed, by the public prints, which Captain King had brought with him from Canton, of instructions having been found on board all the French ships of war, that had been taken in Europe, importing, that their Commanders, if they should happen to fall in with the Resolution and Discovery, were to suffer them to proceed unmolested on their voyage. It was also reported, that the American Congress had given similar orders to the vessels employed in their service. This intelligence being further confirmed by the private letters of some of the super-cargoes, Captain King deemed it incumbent on him, in return for the liberal exceptions which our enemies had made in our favour, to refrain from embracing any opportunities of capture, and to maintain the strictest neutrality during the whole of our voyage. Having got under sail about two o'clock, P. M. we passed the fort of Macao, and saluted the garrison with eleven four-pounders, which they answered with an equal number. We were under the necessity of warping out into the entrance of the Typa, which we gained by eight o'clock in the evening of the 13th; and lay there till nine o'clock the following morning, when we stood, with a fresh easterly breeze, to the S. between Wungbo and Potoe. At four in the afternoon, the Ladrone was about two leagues distant in an eastern direction. On Saturday, the 15th, at noon, we observed in lat. 18 deg. 57 min. long. 114 deg. 13 min. On the 16th, we struck soundings over Macclesfield Bank, and found the depth of water to be 50 fathoms, over a bottom consisting of white sand and shells. We computed this part of the bank to be situated in lat. 15 deg. 51 min. and in long. 114 deg. 20 min. Thursday, the 19th, at four o'clock P. M. we had in view Pulo Sapatra, bearing N. W. by W. and distant about four leagues. Having passed this island, we stood to the westward; and on the 20th made the little group of islands known by the name of Pulo Condore, at one of which we anchored in six fathoms water. The harbour where we now moored, has its entrance from the N. W. and affords the best shelter during the N. E. monsoon. Its entrance bore W. N. W. quarter W. and N. by W. the opening at the upper end bore S. E. by E. three quarters E. and we were about 2 furlongs distant from the shore. On the

21st, early in the morning, parties were sent out to cut wood, the Commodore's principal motive for touching at this island being to supply the ships with that article. None of the natives having as yet made their appearance, notwithstanding two guns had been fired at different times, Captain Gore thought it advisable to land, and go in search of them. Accordingly, on Sunday, the 22nd, he desired Captain King to attend him. They proceeded in their boats along shore for the space of two miles, when perceiving a road that led into a wood, they landed. Here Captain King left the Commodore, and, attended by a midshipman, and four armed sailors, pursued the path, which appeared to point directly across the island. They proceeded through a thick wood up a steep hill, to the distance of a mile, when after descending, they arrived at some huts. Captain King ordered the party to stay without, lest the sight of armed men should terrify the inhabitants, while he entered and reconnoitred alone. He found, in one of the huts, an elderly man, who was in a great fright, and preparing to make off with the most valuable effects. However a few signs, particularly that most significant one of holding out a handful of dollars, and then pointing to a herd of buffaloes, and the fowls that were running about the huts in great numbers, left him without any doubts as to the objects of their visit. He pointed towards a place where the town stood, and made them comprehend, that by going thither, all their wants would be supplied. On their first coming out of the wood, a herd of buffaloes, to the number of 20 at least, came running towards them, tossing up their heads, snuffing the air, and roaring in a hideous manner. They had followed them to the huts, and now stood drawn up in a body, at a little distance; and the old man made them understand, that it would be exceeding dangerous to move, till they were driven into the woods; but so enraged were the animals grown, at the sight of them, that this was not effected without a good deal of time and difficulty. The men not being able to accomplish it, they called to their assistance a few little boys, who soon drove them out of sight. Afterward they had an opportunity of observing, that in driving these animals, and securing them, which is done by putting a rope through a hole made in their nostrils, little boys were always employed, who could stroke and handle them with impunity at times, when the men durst not approach them. Having got rid of the buffaloes, they were conducted to the town, which consists of between 20 and 30 houses, built close together; besides 6 or 7 others that are scattered about the beach. The roof, the two ends, and the side fronting the country, are neatly constructed of reeds; the opposite side, facing the sea, is entirely open; but, by means of a kind of bamboo screens, they can exclude or let in as much of the sun and air as they please. They were conducted to the largest house, where the chief, or captain, as they called him, resided, but he was absent, or would not be seen; therefore no purchases could, as they said, be made. At two o'clock, in the afternoon, they returned to the ships; as did likewise several of our shooting parties from the woods, about the same time. At five o'clock, six men in a proa, rowed up to the ships, from the upper-end of the harbour; and one of them, who was a person of decent appearance, introduced himself to Captain Gore, with an

deg. S. lat. and in long. 106 deg. 12 min. They lie nearly N. and S. from each other, encompassed by a reef of coral rocks. At noon, we had sight of the island of Java; and about four in the afternoon, we perceived two vessels in the straits of Sunda; one of which lay at anchor near the mid-channel island, the other nearer the shore of Java. On the 8th, about eight o'clock in the morning, we weighed, and proceeded through the straits of Sunda. On Wednesday the 9th, between ten and eleven, Captain King was ordered by the Commodore to make sail towards a Dutch vessel, that now came in sight to the southward, which we imagined was from Europe; and, according to the nature of the information that might be obtained from her, either join him at Cracatoa, or to proceed to the south-eastern extremity of Prince's island, and there provide a supply of water, and wait for him. In compliance with these instructions Captain King bore down towards the Dutchman; and on the 10th, in the morning, Mr. Williamson went on board her; where he was informed, that she had been seven months from Europe, and three from the Cape of Good Hope; that, before her departure, the kings of France and Spain had declared war against his Britannic Majesty; and that she had left Sir Edward Hughes at the Cape with a squadron of men of war, and also a fleet of East India ships. On the return of Mr. Williamson, Captain King took the advantage of a fair breeze, and made sail towards the island of Cracatoa, where he soon after perceived the *Resolution* at anchor, and immediately dispatched a boat to communicate to Captain Gore the intelligence procured by Mr. Williamson. When we saw our consort preparing, at the distance of near two leagues, to come to, we fired our guns, and displayed the signal for leading a-head, by hoisting an English jack at the ensign staff. This was intended to prevent the *Discovery's* anchoring, on account of the foul ground, which the maps on board our ship placed in this situation. However, as Captain King met with none, but, on the contrary, found a muddy bottom, and good anchoring ground, at the depth of 60 fathoms, he remained fast till the return of the boat, which brought him orders to proceed to Prince's Island the ensuing morning.

Cracatoa is the southernmost of a cluster of islands lying in the entrance of the straits of Sunda. It has a lofty peaked hill at its southern extremity, situated in lat. 6 deg. 9 min. S. and in long. 105 deg. 15 min. E. The whole circumference of the island does not exceed nine miles. The island of Sambouricou, or Tamarin, which stands 12 miles to the northward of Cracatoa, may easily be mistaken for the latter, since it has a hill of nearly the same figure and dimensions, situate likewise near its south end. The lat. of the road where we cast anchor is 8 deg. 6 min. S. long. by observation, 105 deg. 36 min. E. It is high water on the full and change days, at seven o'clock in the morning; and the water rises three feet two inches perpendicular.

On Friday, the 11th, at three o'clock, A. M. the *Discovery* weighed anchor, and steered for Prince's Island; and, at noon, she came to, and moored off its eastern extremity. On Monday, the 14th, at day break, we descried our consort, and, at two o'clock P. M. we anchored close by her. By the 16th, both ships started their casks, and had replenished them with fresh water. In the evening the decks were cleared, and we prepared for sea. On Saturday, the 19th, being favoured with a westerly breeze, we broke ground, to our extreme satisfaction, for the last time in the straits of Sunda; and on the 20th, we had totally lost sight of Prince's Island. If Mr. Lanyon had not been with us, we should probably have met with some difficulty in finding the watering place: it may, therefore, not be improper to give a particular description of its situation, for the benefit of subsequent navigators. The peaked hill on the island bears N. W. by N. from it. A remarkable tree, which grows on a coral reef, and is entirely detached from the adjacent shrubs, stands just to the north of it; and a small plot of reedy grass, may be seen close by it. These marks will indicate the place where the pool dis-

No. 79.

charges itself into the sea; but the water here, as well as that which is in the pool, being in general salt, the casks must be filled about 50 yards higher up; where, in dry seasons, the fresh water which descends from the hills, is in great measure lost among the leaves, and must therefore be searched for by clearing them away. The lat. of the anchoring-place at Prince's Island, is 6 deg. 36 min. 15 sec. S. and its long. 105 deg. 17 min. 30 sec. E.

On Friday, the 25th, we were attacked with a violent storm, attended with thunder, lightning, and heavy rain. From the 26th to the 28th of March, we had a regular trade wind from the S. E. to E. by S. accompanied with fine weather; and as we sailed in an old beaten track, no incident worthy of notice occurred. It had hitherto been Captain Gore's intention to proceed directly to St. Helena, without stopping at the Cape, but our rudder having been for some time complaining, and, on being examined, reported to be in a dangerous state, he resolved to steer directly for the Cape, as the most eligible place, both for the recovery of the sick, and for procuring a new main piece for the rudder.

Monday, the 10th of April, a snow was seen bearing down, which proved to be an English East India packet, that had left Table Bay three days before, and was cruising with orders for the China fleet, and other India ships. She told us, that, about three weeks before, *Monf. Trongollar's* squadron, consisting of six ships, had sailed from the Cape, and was gone to cruise off St. Helena, for the English East Indiamen. The next morning we stood into Simon's Bay. At eight o'clock, we came to anchor, at the distance of one third of a mile from the nearest shore; the S. E. point of the bay bearing S. by E. and Table Mountain N. E. half N. The *Nassau* and *Southampton* East Indiamen were here, in expectation of a convoy from Europe. We saluted the fort with eleven guns, and were complimented with an equal number in return. As soon as we had cast anchor, Mr. Brandt, the governor of this place, favoured us with a visit. This gentleman had the highest regard for Captain Cook, who had been his constant guest, whenever he had touched at the Cape; and though he had, some time before, received intelligence of his untimely fate, he was extremely affected at the sight of our vessels returning without their old Commander. He was greatly surprised at seeing most of our people in so healthy a state, as the Dutch ship which had quitted Macao, at the time of our arrival there, and had afterwards stopped at the Cape, reported, that we were in a most wretched condition, there being only 15 hands left on board the *Resolution*, and seven in the *Discovery*. It is difficult to conceive what could have induced these people to propagate so infamous a falsehood.

On Saturday the 15th, Captain King accompanied our Commodore to Cape Town; and the next day, in the morning, they waited on Baron Plettenberg, the Governor, who received them with every possible indication of civility and politeness. He entertained a great personal esteem for Captain Cook, and professed the highest admiration of his character, and on hearing the recital of his affecting catastrophe, broke forth into many expressions of unaffected sorrow. In one of the principal apartments of the Baron's house, he shewed our gentlemen two pictures, one of De Ruyter, the other of Van Tromp, with a vacant space left between them, which, he said, he intended to fill up with the portrait of Captain Cook; and for this purpose he requested that they would endeavour to procure one for him, on their arrival in Great Britain, at any price. During our continuance at the Cape, we met with the most friendly treatment, not only from the Governor, but also from the other principal persons of the place, as well Africans as Europeans.

Falke Bay lies to the eastward of the Cape; and at the distance of about 12 miles from the latter, on the western side is Simon's Bay, the only commodious station for shipping to lie in. To the N. N. eastward of this bay, there are some others, from which, however, it may with ease be distinguished, by a remarkable sandy way to the N. of the town, which forms a conspicuous

object. The anchoring place in Simon's Bay, is situated in the lat. of 34 deg. 20 min. S. and its long. is 18 deg. 29 min. E. In steering for the harbour, along the western shore, there is a small flat rock, known by the name of Noah's Ark; and about a mile to the N. eastward of it, are others, denominated the Roman Rocks. These are a mile and a half distant from the anchoring place; and either to the northward of them, or between them, there is a safe passage into the bay. When the N. westerly gales are set in, the navigator, by the following bearings, will be directed to a secure and convenient station: Noah's Ark S. 51 deg. E. and the center of the hospital S. 53 deg. W. in 7 fathoms water. But if the S. easterly winds should not have ceased blowing, it is more adviseable to remain farther out in 8 or 9 fathoms water. The bottom consists of sand, and the anchors, before they get hold, settle considerably. About two leagues to the eastward of Noah's Ark, stands Seal Island, whose southern part is said to be dangerous, and not to be approached, with safety, nearer than in 22 fathoms water.

On Tuesday the 9th of May, signal was made for unmooring, and, about noon, we took our departure from Simon's Bay. We had now provisions, live stock, water, and naval stores, aboard in great plenty: also healthy crews, in high spirits, wishing for nothing but a fair wind to shorten our passage home. On the 14th, we got into the S. E. trade wind, and stood to the W. of the islands of Ascension and St. Helena. Wednesday, the 31st, we were in lat. 12 deg. 48 min. S. long. 15 deg. 40 min. W. On Saturday the 10th of June, the Discovery's boat brought us word, that, in exercising her great guns, the carpenter's mate had his arm shattered in a shocking manner, by part of the wadding being left in after a former discharge; another man was slightly wounded at the same time. On the 12th, it began to blow very hard; and continued so till the next day, when we crossed the line to the northward, for the fourth time during our voyage, in the long. of 26 deg. 16 min. W.

On Saturday the 12th of August, we descried the

western coast of Ireland, and endeavoured in vain to get into Port Galway, but were compelled by violent southerly winds, to stand to the N. The wind continuing in the same quarter we made the island of Lewis.

On Tuesday, the 22nd, about eleven o'clock A. M. both ships came to anchor at Stromness in Scotland: from whence the Commodore sent Captain King to inform the Lords of the Admiralty of our arrival.

On the 30th, we arrived off Yarmouth, in company with his Majesty's sloops of war the Fly and Alderney. Our boats were immediately sent on shore for provisions, and for a spare cable for our small bower, that we had being nearly worn out.

On the 4th of October, 1780, the Resolution and Discovery reached the Nore in safety; and, on the 6th, dropped anchors at Deptford; having been absent four years, three months, and two days.

It is very extraordinary, that in so long and hazardous a voyage, the two ships never lost sight of each other for a day together except twice; the first time, owing to an accident that happened to the Discovery off the coast of Owhyhee; the second, to the fogs they met with at the entrance of Awatska Bay; a striking proof of the skill and vigilance of the subaltern officers. Another circumstance, no less remarkable, is, the uncommon healthiness of the companies of both ships. When Captain King quitted the Discovery at Stromness, he had the satisfaction of leaving the whole crew in perfect health; and, at the same time, the number of sick persons on board the Resolution did not exceed two or three, only one of whom was incapable of service. In the whole course of the voyage, the Resolution lost no more than five men by sickness; the Discovery not one. A strict attention to the excellent regulations, established by Captain Cook, with which our readers have been made acquainted, and the use of that excellent medicine, Peruvian bark, may justly be deemed the chief causes, under the blessing of an all-directing Providence, of this extraordinary success.

At the Cape of Good Hope,

CONCLUDING REMARKS by the EDITOR.

IN order to convince our subscribers and the public of the just preference due to this new and complete Collection of Captain Cook's Voyages, &c. round the World, and how unreservedly they may depend on the punctual execution of the Publisher's other periodical publications, on various useful and interesting subjects, it will be necessary to make a few remarks on the imperfections most glaringly conspicuous in most works of the kind; and also to point out the peculiar useful information, and important improvements, with which this genuine Edition of Cook's celebrated voyages abound; whereby we flatter ourselves, the unprejudiced, and disinterested, whose delight may be to employ their hours of leisure in the attainment of substantial knowledge, will not withhold from our several undertakings, and laborious endeavours to please, that encouragement they may be thought justly to deserve.

It has been too common a practice of late, to usher periodical publications into the world with a good appearance at first, and, in the course of their execution, to fall off from their original perfection; so that when concluded, they cannot, properly speaking, for want of uniformity, and due order, be deemed complete and perfect. We think, upon the whole, not one of our readers can, with justice, charge us with such defects, and unfair artifices. The latter numbers of our weekly publications, are, in general, equal in goodness to the former; and the whole are finished in so regular, uniform, and complete a manner, as, of which we have been repeatedly assured, answer the wishes both of the publisher and readers, by doing credit to the one, and giving full and pleasing satisfaction to the other. Let any impartial examiner compare the concluding numbers of Millar's Universal System of Geography, Barnard's New History of England, and this Complete Collection of Voyages Round the World, with any other works of the like kind, and, we are persuaded, they will distinguish on which side superior excellence lies; such a comparative view we earnestly request; not doubting, but that, agreeable to their usual candour, the Public will readily give merit the preference. Indeed, the just preference which is now generally given by the public to our various periodical publications, is a very flattering testimony in their favour. We have gone out of the common beaten track, and carried on business with a degree of credit and reputation, hitherto unattempted by our predecessors, and present competitors in the same line, which has effectually established a reputation with the public at large, who can depend safely upon the honourable and punctual execution of any work, which we announce for publication.

Our friends, and readers, will also please to observe, that most of the publications of our competitors, are spun out to an unreasonable length, by loose printing, or small pages, merely to answer pecuniary purposes; or, on the other hand, they have been mere abridgments, being contracted in too confined a compass, and so mutilated, and frivolous, as scarcely to deserve notice. Now it has been our invariable aim, to render every work that has been the object of our study, the very best, and most perfect of the kind. We dare not affront a discerning and generous public in a single instance, whereby they may have reason to say, our promises have not been honourably performed. We have always given full scope to the necessary copiousness and importance of the subject; while, at the same time, it has been our constant endeavour to preserve a happy medium between the two extremes, by not extending our performances further than absolute necessity may require: thus disdaining to renounce our respect for the public, by promoting, unnecessarily, the private interest of any of the artists concerned in their external execution.

One would think it must be obvious to the most cursory reader, how artfully many recent publications have been puffed off in a very pompous manner by certain adventurers, in order to take the advantage of credulity;

notwithstanding they are too contemptible to come under the eye of criticism, being void of excellencies, and replete with errors, though offered to the public on very extravagant terms. With respect to these particulars, we apprehend the advantages over all similar publications are much in our favour. Our plans we have always endeavoured to render improved and extensive. Our materials have not been an indigested heap, put together without judgment; not a jumble of plagiarisms and piracies, of vain conjectures, paltry interpolations, ridiculous suppositions, and palpable falsities; but they are a select, judicious collection, extracted from the most approved authors, founded on the most respectable authorities, and arranged with the greatest accuracy and care. This authentic, and complete Collection of Cook's Voyages, &c. Round the World, is a real new undertaking, the result of the most laborious assiduity; and containing all the new improvements, and all the late discoveries, made in every part of the globe; for, which we request our friends and readers particularly to notice, we have not only corrected the journals put into our hands, by genuine records, but, with a view of rendering this work the best and most complete of the kind, we have enriched it by interweaving therein the substance of all the most remarkable and important Voyages and Travels, which have been undertaken, at various times, to the different quarters of the world; particularly those of Cavendish, Vazquez de Gama, Dampier, Raleigh, Columbus, Magellan, Hanway, Hamilton, Herbert, Drummond, Pocock, Shaw, Stuart, Kalm, Carver, Dalrymple, &c. &c.

In all the performances of those compilers that have hitherto come under our observation, and we have examined carefully not a few of them, it has greatly surprised us, when we found they slavishly followed each other, not having corrected even the most palpable errors. And, in order to give their imperfect and incorrect works a temporary credit, the most mean and paltry artifices have been employed by certain persons, to mislead the unwary; which persons have ignorantly and piratically copied our proposals and advertisements, and applied them to old and imperfect publications, in order to give them a new appearance.

It has also happened frequently, that, either from want of genius, or in order to conceal a servile imitation, they have enlarged on the least interesting parts of their subject, and have passed over slightly others, to elucidate or decorate which required a particular attention. Here, with a degree of self-satisfaction, we can appeal to the decision of public judgment, and leave the question to be determined by the unprejudiced peers, whether, in any of our works offered to their consideration, and calculated for general use, we have cut them short, or mangled them by the pen of ignorance, or spun them out with a tedious prolixity, to answer private purposes. In this work, every particular circumstance worthy of notice has been included; yet, though the narratives are circumstantial, it has been our study to render them entertaining, comprehensive, and interesting. This work contains the whole of Captain Cook's Voyages complete, with all the splendid folio copper-plates: so that our readers have not been imposed upon by being presented with a mutilated, imperfect, spurious edition, a trifling abridgment, or a mere compendium. We are now naturally led to point out the important improvements, with which this edition of these celebrated voyages abounds, whereby its superiority over all other works of the like kind will evidently appear.

Captain Cook's first, second and third voyages, were undertaken by order of his present Majesty, for making discoveries in the northern and southern hemispheres, and were successively performed in a period, from the year 1768, to 1780, inclusive. The first voyage was undertaken in His Majesty's ship the Endeavour, for making discoveries in the southern hemisphere, and round the world. The second in the Resolution.

solution and Adventure, for making discoveries towards the South Pole, and round the world. The third and last, in the Resolution and Discovery, to the Pacific Ocean, but, principally, to determine the position and extent of the west side of North America; its distance from Asia; and the practicability of a north-west passage into the Atlantic, and to Europe. To follow the exact researches of this eminent navigator, whose discoveries have far exceeded those of all his predecessors, has been our arduous task. It is unnecessary to point out the obvious imperfections of all publications which include only a single voyage of this celebrated Commander; his three different voyages are so immediately connected together, that owing to frequent references from one to another, no person can form a satisfactory idea of his valuable discoveries, who does not read his first, second, and third voyages, in the order in which they were performed and written. For these reasons we thought it our indispensable duty to give an accurate relation, and to record an authentic history of the whole of Captain Cook's voyages; to which we have added genuine and complete narratives of other remarkable voyages round the world, undertaken and performed by English circumnavigators, under the sanction of government. And with a view of rendering this work in every respect conformable to our proposals, we have incorporated a faithful relation of the substance of all the most remarkable and important Travels and Journeys, which have been undertaken, at different times, to the four quarters of the world; particularly, besides what we have already mentioned, those of Burnet, Addison, Barretti, Keyser, Thicknes, Twiss, Bridone, Chandler, Johnson, Smollet, Moore, Wraxall, &c.

In the geographical part of Captain Cook's voyages, we have availed ourselves of the labours, and made a free use of the discoveries of those eminent writers, as may plainly be seen in our descriptions of the several islands in the Atlantic, Southern, Pacific, and Indian seas; containing an historical relation, not to be found in any publication of the like kind. A thorough knowledge of the islands and harbours, where ships may safely repair for refreshments, and other purposes, is of the utmost consequence to navigators in their pursuit of discoveries; and geography has a peculiar claim to the attention of mankind in general, seeing this useful science

displays to our view, in the most entertaining manner, a general knowledge of the world. To promote which, to the observations of former travellers, noticed above, we have added very recent discoveries made by those celebrated circumnavigators, whose entertaining and useful voyages employ part of this work, viz. Byron, Wallis, Carteret, Mulgrave, Anson, &c.

In the astronomical and nautical parts of this work, we have not tired the patience of our readers, with useless computations, trifling suppositions, and dry sets of solar and lunar observation; yet we have not failed, in any one instance, to give the result of these; and we have likewise accurately marked latitude, longitude, dates, time, tides, situation, distance, and bearings, both of places and of the ships. This work may be considered as a kind of universal history; but with respect to the style, we have preserved that of our journals, as those would naturally do, who are not unacquainted with the principles of navigation, and maritime affairs.

As to the historical and descriptive parts of this work of labour, they comprehend a particular, full, accurate, circumstantial, and entertaining account of continents, islands, seas, oceans, straits, rivers, harbours, promontories, bays, &c. &c. together with a useful and diverting descriptive relation of the natives, or inhabitants, their situation, extent, boundaries, limits, soil, natural and artificial curiosities, and productions: their laws, religion, customs, manners, genius, arts, tempers, dispositions, amusements, language, shape, stature, dress, virtues, and vices; their governments, principalities, titles of distinction, and singular ceremonies at births, marriages, and funerals, &c. &c. including also the natural history of birds, beasts, fishes, reptiles, insects, and vegetable productions, found in the hitherto unexplored regions of the world. And among the greatest variety of the most interesting transactions, we have given a faithful narrative of the extraordinary life and unfortunate death of that brave Commander, Captain Cook; in which, as also in our account of Captain Clerke's death, our readers will find several particulars never before made known to the public. Of that public, and our friendly subscribers, we now take leave, with the pleasing hopes, that they will maturely consider the above remarks, bring them to the test of truth, and give merit the preference upon every occasion.

F I N I S.

CONTENTS of this WORK.

Directions to the Binder	656
List of Subscribers	657

N. B. In writing the Histories of the above very valuable and celebrated Voyages round the World, &c. the Editor has not only carefully incorporated all the important Discoveries made by other Voyagers and Circumnavigators, but has also included the Substance of the most remarkable Travels to different Parts of the World.

The whole now re-publishing with all the Copper-plates, in only 80 Sixpenny Numbers: one or more of which may be had at a Time, at the Option of Purchasers—or the Whole handsomely bound in Calf and lettered, complete in one large Volume, Price £2 8 0

DIRECTIONS to the BOOKBINDER,

For Placing the ELEGANT COPPER-PLATES belonging to

ANDERSON's Folio Edition of COOK's VOYAGES, &c. Complete.

N. B. The Bookbinder is particularly desired to beat *This Work* before the Copper-plates are placed, that the Letter-press may not set off on, and thereby spoil the Engravings, which must be placed as follow:

No. 1.	FRONTISPIECE, being a Portrait of Captain James Cook, F. R. S. &c.	To face the Title Page.
	Sea Horses, which Captain Cook met with in his Third Voyage	561
	Chart of the Sandwich Islands	549
2.	View of Christmas Harbour, with the manner of killing Penguins, &c.	421
	Portraits of a Man and Woman of Kamtschatka	635
3.	A Man of Kamtschatka travelling in Winter	614
	Portraits of Poulaho, King of the Friendly Islands—and a Woman of Middleburgh	454
4.	View of Summer and Winter Habitations, in Kamtschatka	639
	Portraits of a Man—and Woman of Oonalashka	571
5.	The Inhabitants of Norton Sound, and their Habitations	566
	View in the Town of Bolcheretik, the Capital of Kamtschatka	616
	Portraits of a Man—and Woman of Prince William's Sound	547
7.	A young Sea Otter—an Opposum—and a White Bear	426
	Representation of a Canoe of the Sandwich Island	533
8.	A Man of the Sandwich Islands Masked—and a Man of the Sandwich Islands, Dancing	605
	Chart of Norton Sound and Beering's Strait	566
9.	Portraits of a Man—and Woman of the Sandwich Islands	531
	An inland View in Atooi	601
10.	Representation of a Dance in Otaheite	41
11.	View of the Inside of a House in Ulitea	475
	View of a Fiatooka, or Burying Place, in Tongataboo	462
12.	View of the House or Shed, called Tupapow, in Otaheite	482
	Portraits of a Man—and Woman of Nootka Sound	539
13.	View of the Indians of Terra Del Fuego	12
	Various Articles of Nootka Sound—and of the Sandwich Islands	540
14.	A Native of Otaheite defying his Enemy, &c.	491
	The body of Tee, a Chief, as preserved after Death, in Otaheite	492
15.	View of a Morai, or Burial Place of Atooi	526
16.	Habits of a young Woman of Otaheite bringing a Present—and a young Woman Dancing	491
	View of Endeavour River, on the Coast of New Holland	65
17.	View of a Boxing Match in Hapace—and a Portrait of a Man of Manglea, &c.	451
	Mr. Banks receiving a Visit from the King of Duke of York's Island, &c.	15
18.	The Attack on Captain Wallis in the Dolphin, by the Natives	264
	Various Articles of Otaheite and New Zealand	541
19.	A Chest of New Zealand, as a specimen of the Carving of that Country, &c.	435
	View of Karakakoda, in Owhyhee	577
20.	View in the Island of Hunheine, &c.	40
	View of the Inside of a Winter Habitation in Kamtschatka	639
21.	View of the Island of Otaheite, with several Vessels	14
	Inside of the House in the Morai, in Atooi—and Canoes of Oonalashka	572
22.	Terreoboo King of Owhyhee, bringing Presents to Capt. Cook	580
	View of an Arched Rock on the Coast of New Zealand, &c.	53
23.	The Surrender of the Island of Otaheite to Captain Wallis	482
	A Chief and other Natives of Otaheite, visiting Capt. Cook	15
24.	View of a Fortified Town or Village, called a Hippah	45
	Remarkable Animal found on one of the Hope Islands—and the Vari, or Maucuco	65
25.	View of the Town and Harbour of St. Peter and St. Paul	634
	A Woman and Boy of Patagonia in South America	223
26.	View of Saug Corner Cove in Prince William's Sound	546
	General Chart exhibiting the Discoveries made by Captain Cook in his First, Second, Third, and Last Voyages	5
27.	Death of Captain James Cook	587
	Charts of the N. W. Coast of America—and N. E. Coast of Asia	563
28.	A larger View of that Celebrated Natural Curiosity the Perforated Rock, in New Zealand	45
	The Desire in a dangerous Storm near the Straits of Magellan	340
29.	View at Anamooka	447
	The Success wedged on a Rock at Umata	345
30.	Representation of a War Canoe of New Zealand	57
	Capt. Wallis in conversation with Oherea the Qu. of Otaheite	265
31.	View of Matavai Bay in Otaheite	135
	Bougainville hoisting French Colours in Magellan Straits	230
32.	Portraits of a Man—and Woman of Tanna	171
	Chart of the Friendly Islands	472
33.	An Offering before Capt. Cook at one of the Sandwich Islands	579
	The Engagement of the Centurion and Acapulco off Cape Espiritu Santo	364
34.	View of the Habitations in Nootka Sound	539
	Map of Kerguelen's Land	420
35.	View of Monuments, &c. in Easter Island	171
	Affecting Interview of two Moskito Men on the Island Juan Fernandez	343
36.	Portraits of a Man—and Woman of Easter Island	142
	Charts of Van Diemen's Land	427
37.	Portraits of a Man—and Woman of Sta. Christina	148
	Views of Sandwich Islands	593
38.	Portraits of a Man—and Woman of Christmas Sound	524

No. 38.	Commodore Anson attending King George II. with an Account of his Voyage	336
39.	The Landing of Captain Cook at Mallicollo	164
	View of Sir Charles Saunder's Island, &c.	270
40.	Views on the Coast of Kamtschatka	611
	Portraits of a Man—and Woman of New Zealand	56
41.	Portraits of a Man—and Woman of New Caledonia	175
	View of Sulphur Island	643
42.	The Natche, a Ceremony in Honour of the King's Son	466
	The Genius of the Work instructing Youth in the conduct of Circumnavigators	336
43.	Boats of the Friendly Isles	475
	Views on the West Coast of America	544
44.	A Human Sacrifice, in a Morai, in Otaheite	487
	Mr. Doughty, beheaded by order of Sir Francis Drake	384
45.	Portraits of a Man—and Woman of Mallicollo	165
	View of Resolution Bay, in the Marquesas	148
46.	The Reception of Captain Cook, in Hapace	450
	The North East View of the Island of Otaheite	135
47.	A Toupapow, with a Corpse on it	16
	Mode of Dancing in Ulitea—and a Morai, or Burying Place in Otaheite	511
48.	The Tichutki, and their Habitations	559
	Chart of the Islands of Otaheite	14
49.	Portraits of Ohedidee and Otago	141
	Ceremony of treading on the Crucifix at Nagasaki	367
50.	View in the Island of Rotterdam	455
	Vaquez de Gama introduced to the Zamoran of Calcutta	368
51.	The Landing of Captain Cook, at Middleburgh	140
	View of the South Side of Adventure Bay	424
52.	Natives of Oonalashka, and their Habitations	554
	Gonzalo Pizarro, beheaded at Guzeo	346
53.	The King of the Friendly Islands drinking Kava	468
	Begging Devouts who Stroll through China	366
54.	View of Huasheine	500
	Draught of Bonthain Bay	302
55.	The Landing of Captain Cook at Tanna	166
	Chart of Cook's Strait in New Zealand	52
56.	View in the Island of Pines	179
	The Fleet of Otaheite, assembled at Oparree	493
57.	View of the Race Horse and Carcass, inclosed in the Ice	326
	Sketch of the Typa and Macao	644
58.	View of a Fatooka, a Burying Place in Amsterdam Island	462
	Portraits of a Man, Woman, and Child, of Van Diemen's Land	424
59.	The Interview between Commodore Byron and the Patagonians	222
	Portraits of Ootoo, King of Otaheite and Tynat-Mai	135
60.	View in Possession Bay, in the Island of South Georgia	187
	Plan of Success Bay, and a Chart of Terra Del Fuego	185
61.	View of the Ice Islands	191
	View in Christmas Sound, Tierra Del Fuego	184
62.	A Night Dance by Men in Hapace	452
	Three Views of an Arched Point on Kerguelen's Land	420
63.	Views of the Land on the West Coast of America	623
	The Grand Seigneur, in an Elegant Turkish Habit	393
64.	Portraits of Pointow and Omai	481
	Island of St. John, &c.	285
65.	View in the Island of New Caledonia	175
	The Rejoicings of the Mexicans	351
66.	Chart of the Island of Otaheite	25
	Chart of Capt. Carter's Discoveries at New Britain	285
67.	The inside of a House, in Nootka Sound	540
68.	The Landing of Captain Cook, at Erramanga	165
	Matavai Bay in Otaheite, &c.	135
69.	View of Part of the N. E. side of Terra del Fuego, &c.	10
	Chart of the Society Isles	515
70.	Plan of the Bay of Awatka	611
	An Image Worshipped by the Chingulais	365
71.	Views on the Coast of Asia	563
	Chart of Cook's River in America	55
72.	Inside of a House in Oonalashka	571
	Sketch of Tongataboo Harbour	465
73.	Sketch of Nootka Sound	538
	Sketch of the Harbour of Samganooodha	568
74.	Mangea Island, &c.	439
	View of the North West Side of Mas-a-Fuera	279
75.	A Night Dance of Women in Hapace	452
	Chart of Christmas Island	524

The Publisher of this Work returns his most respectful Acknowledgments to the very numerous Subscribers for their great Encouragement, and humbly solicits a Continuance of their Favours with Respect to some of his other New Publications (a List of which may be seen in his Catalogue, or on some of the Wrappers of this Publication, &c.) assuring them, that nothing shall be wanting to render all the Periodical Works in which he shall be engaged, deserving the Public Patronage. Notwithstanding printed Notices given for the Purpose, several Weeks ago, and other necessary Steps taken for collecting the Whole, we have not been able to procure the Names of a tenth Part of our obliging Subscribers. Those whose Names are not in the List, will therefore, of course, excuse the Omission; and such as find any Error in Spelling, will please to observe, that the Fault is not chargeable on the Publisher, as he has ordered the Names, Places of Abode, &c. to be literally transcribed from the Notes, as delivered in by the various Bookfellers, Stationers, Newsmen, &c. &c.
